Updated 11th May 2021

This is an unofficial Python wrapper for the Binance exchange REST API v3. I am in no way affiliated with Binance, use at your own risk.

If you came here looking for the Binance exchange to purchase cryptocurrencies, then go here. If you want to automate interactions with Binance stick around.

If you're interested in Binance's new DEX Binance Chain see my python-binance-chain library

Source code https://github.com/sammchardy/python-binance

Documentation https://python-binance.readthedocs.io/en/latest/

Binance API Telegram https://t.me/binance_api_english

Blog with examples including async https://sammchardy.github.io

- Async basics for Binance
- Understanding Binance Order Filters

Make sure you update often and check the Changelog for new features and bug fixes.

Contents 1

2 Contents

CHAPTER 1

Features

- Implementation of all General, Market Data and Account endpoints.
- Asyncio implementation
- Testnet support for Spot, Futures and Vanilla Options
- Simple handling of authentication
- No need to generate timestamps yourself, the wrapper does it for you
- Response exception handling
- Websocket handling with reconnection and multiplexed connections
- Symbol Depth Cache
- Historical Kline/Candle fetching function
- Withdraw functionality
- Deposit addresses
- Margin Trading
- Futures Trading
- Vanilla Options
- Support other domains (.us, .jp, etc)

4 Chapter 1. Features

CHAPTER 2

Upgrading to v1.0.0+

The breaking changes include the migration from wapi to sapi endpoints which related to the wallet endpoints detailed in the Binance Docs

The other breaking change is for websocket streams and the Depth Cache Manager which have been converted to use Asynchronous Context Managers. See examples in the Async section below or view the websockets and depth cache docs.

CHAPTER 3

Quick Start

Register an account with Binance.

Generate an API Key and assign relevant permissions.

If you are using an exchange from the US, Japan or other TLD then make sure pass *tld='us'* when creating the client. To use the Spot or Vanilla Options Testnet, pass *testnet=True* when creating the client.

```
pip install python-binance
```

```
from binance import Client, ThreadedWebsocketManager, ThreadedDepthCacheManager
client = Client(api_key, api_secret)
# get market depth
depth = client.get_order_book(symbol='BNBBTC')
# place a test market buy order, to place an actual order use the create_order_
\hookrightarrow function
order = client.create_test_order(
   symbol='BNBBTC',
   side=Client.SIDE_BUY,
   type=Client.ORDER_TYPE_MARKET,
   quantity=100)
# get all symbol prices
prices = client.get_all_tickers()
# withdraw 100 ETH
# check docs for assumptions around withdrawals
from binance.exceptions import BinanceAPIException
try:
    result = client.withdraw(
        asset='ETH',
        address='<eth_address>',
        amount=100)
```

(continues on next page)

```
except BinanceAPIException as e:
   print(e)
else:
   print("Success")
# fetch list of withdrawals
withdraws = client.get_withdraw_history()
# fetch list of ETH withdrawals
eth_withdraws = client.get_withdraw_history(coin='ETH')
# get a deposit address for BTC
address = client.get_deposit_address(coin='BTC')
# get historical kline data from any date range
# fetch 1 minute klines for the last day up until now
klines = client.get_historical_klines("BNBBTC", Client.KLINE_INTERVAL_1MINUTE, "1 day_
→ago UTC")
# fetch 30 minute klines for the last month of 2017
klines = client.get_historical_klines("ETHBTC", Client.KLINE_INTERVAL_30MINUTE, "1...
→Dec, 2017", "1 Jan, 2018")
# fetch weekly klines since it listed
klines = client.get_historical_klines("NEOBTC", Client.KLINE_INTERVAL_1WEEK, "1 Jan,...
\rightarrow 2017")
# socket manager using threads
twm = ThreadedWebsocketManager()
twm.start()
# depth cache manager using threads
dcm = ThreadedDepthCacheManager()
dcm.start()
def handle_socket_message(msg):
   print(f"message type: {msg['e']}")
   print (msg)
def handle_dcm_message(depth_cache):
   print(f"symbol {depth_cache.symbol}")
   print("top 5 bids")
   print (depth_cache.get_bids()[:5])
   print("top 5 asks")
    print (depth_cache.get_asks()[:5])
    print("last update time {}".format(depth_cache.update_time))
twm.start_kline_socket(callback=handle_socket_message, symbol='BNBBTC')
dcm.start_depth_cache(callback=handle_dcm_message, symbol='ETHBTC')
# replace with a current options symbol
options symbol = 'BTC-210430-36000-C'
dcm.start_options_depth_cache(callback=handle_dcm_message, symbol=options_symbol)
```

For more check out the documentation.

CHAPTER 4

Async Example

Read Async basics for Binance for more information.

```
import asyncio
import json
from binance import AsyncClient, DepthCacheManager, BinanceSocketManager
async def main():
    # initialise the client
   client = await AsyncClient.create()
    # run some simple requests
   print(json.dumps(await client.get_exchange_info(), indent=2))
   print(json.dumps(await client.get_symbol_ticker(symbol="BTCUSDT"), indent=2))
    # initialise websocket factory manager
   bsm = BinanceSocketManager(client)
    # create listener using async with
    # this will exit and close the connection after 5 messages
   async with bsm.trade_socket('ETHBTC') as ts:
        for _ in range(5):
           res = await ts.recv()
           print(f'recv {res}')
    # get historical kline data from any date range
    # fetch 1 minute klines for the last day up until now
   klines = client.get_historical_klines("BNBBTC", AsyncClient.KLINE_INTERVAL_
→1MINUTE, "1 day ago UTC")
    # use generator to fetch 1 minute klines for the last day up until now
```

(continues on next page)

```
async for kline in await client.get_historical_klines_generator("BNBBTC",_
→AsyncClient.KLINE_INTERVAL_1MINUTE, "1 day ago UTC"):
       print(kline)
    # fetch 30 minute klines for the last month of 2017
   klines = client.get_historical_klines("ETHBTC", Client.KLINE_INTERVAL_30MINUTE,
→"1 Dec, 2017", "1 Jan, 2018")
    # fetch weekly klines since it listed
   klines = client.get_historical_klines("NEOBTC", Client.KLINE_INTERVAL_1WEEK, "1_
→Jan, 2017")
    # setup an async context the Depth Cache and exit after 5 messages
   async with DepthCacheManager(client, symbol='ETHBTC') as dcm_socket:
        for _ in range(5):
            depth_cache = await dcm_socket.recv()
           print(f"symbol {depth_cache.symbol} updated:{depth_cache.update_time}")
           print("Top 5 asks:")
            print(depth_cache.get_asks()[:5])
            print("Top 5 bids:")
           print (depth_cache.get_bids()[:5])
    # Vanilla options Depth Cache works the same, update the symbol to a current one
   options_symbol = 'BTC-210430-36000-C'
   async with OptionsDepthCacheManager(client, symbol=options_symbol) as dcm_socket:
        for _ in range(5):
           depth_cache = await dcm_socket.recv()
           count += 1
           print(f"symbol {depth_cache.symbol} updated:{depth_cache.update_time}")
           print("Top 5 asks:")
           print (depth_cache.get_asks()[:5])
            print("Top 5 bids:")
            print (depth_cache.get_bids()[:5])
   await client.close connection()
if __name__ == "__main__":
    loop = asyncio.get_event_loop()
    loop.run_until_complete(main())
```

CHAPTER 5

Donate

If this library helped you out feel free to donate.

CHAPTER 6

Other Exchanges

If you use Binance Chain check out my python-binance-chain library.

If you use Kucoin check out my python-kucoin library.

If you use IDEX check out my python-idex library.

6.1 Contents

6.1.1 Getting Started

Installation

python-binance is available on PYPI. Install with pip:

pip install python-binance

Register on Binance

Firstly register an account with Binance.

Generate an API Key

To use signed account methods you are required to create an API Key.

Initialise the client

Pass your API Key and Secret

```
from binance.client import Client
client = Client(api_key, api_secret)
```

or for Asynchronous client

```
async def main():
    # initialise the client
    client = await AsyncClient.create(api_key, api_secret)

if __name__ == "__main__":
    loop = asyncio.get_event_loop()
    loop.run_until_complete(main())
```

Using the Spot, Futures or Vanilla Options Testnet

Binance offers a Spot, Futures and Vanilla Options Testnet, to test interacting with the exchange.

To enable this set the *testnet* parameter passed to the Client to True.

The testnet parameter will also be used by any websocket streams when the client is passed to the BinanceSocketManager.

```
client = Client(api_key, api_secret, testnet=True)
```

or for Asynchronous client

```
client = await AsyncClient.create(api_key, api_secret, testnet=True)
```

Using a different TLD

If you are interacting with a regional version of Binance which has a different TLD such as .us or '.jp' then you will need to pass this when creating the client, see examples below.

This tld will also be used by any websocket streams when the client is passed to the BinanceSocketManager.

```
client = Client(api_key, api_secret, tld='us')
```

or for Asynchronous client

```
client = await AsyncClient.create(api_key, api_secret, tld='us')
```

Making API Calls

Every method supports the passing of arbitrary parameters via keyword matching those in the Binance API documentation. These keyword arguments will be sent directly to the relevant endpoint.

Each API method returns a dictionary of the JSON response as per the Binance API documentation. The docstring of each method in the code references the endpoint it implements.

The Binance API documentation references a *timestamp* parameter, this is generated for you where required.

Some methods have a recvWindow parameter for timing security, see Binance documentation.

API Endpoints are rate limited by Binance at 20 requests per second, ask them if you require more.

Async API Calls

aiohttp is used to handle asyncio REST requests.

Each function available in the normal client is available in the AsyncClient class.

The only difference is to run within an asyncio event loop and await the function like below.

```
import asyncio
from binance import AsyncClient

async def main():
    client = await AsyncClient.create()

    # fetch exchange info
    res = await client.get_exchange_info()
    print(json.dumps(res, indent=2))

    await client.close_connection()

if __name__ == "__main__":
    loop = asyncio.get_event_loop()
    loop.run_until_complete(main())
```

Read Async basics for Binance for more information about asynchronous patterns.

API Rate Limit

Check the get_exchange_info() call for up to date rate limits.

At the current time Binance rate limits are:

- 1200 requests per minute
- 10 orders per second
- 100,000 orders per 24hrs

Some calls have a higher weight than others especially if a call returns information about all symbols. Read the official Binance documentation for specific information.

On each request Binance returns *X-MBX-USED-WEIGHT-(intervalNum)(intervalLetter)* and *X-MBX-ORDER-COUNT-(intervalNum)* headers.

Here are examples to access these

Asynchronous example

```
import asyncio
from binance import AsyncClient

api_key = '<api_key>'
api_secret = '<api_secret>'
```

(continues on next page)

```
async def main():
    client = await AsyncClient.create(api_key, api_secret)

    res = await client.get_exchange_info()
    print(client.response.headers)

    await client.close_connection()

if __name__ == "__main__":
    loop = asyncio.get_event_loop()
    loop.run_until_complete(main())
```

Synchronous example

```
from binance import Client

api_key = '<api_key>'
api_secret = '<api_secret>'

def main():
    client = Client(api_key, api_secret)

    res = client.get_exchange_info()
    print(res.headers)

if __name__ == "__main__":
    main()
```

Requests Settings

python-binance uses the requests library.

You can set custom requests parameters for all API calls when creating the client.

```
client = Client("api-key", "api-secret", {"verify": False, "timeout": 20})
```

You may also pass custom requests parameters through any API call to override default settings or the above settingsspecify new ones like the example below.

```
# this would result in verify: False and timeout: 5 for the get_all_orders call
client = Client("api-key", "api-secret", {"verify": False, "timeout": 20})
client.get_all_orders(symbol='BNBBTC', requests_params={'timeout': 5})
```

Check out the requests documentation for all options.

Proxy Settings

You can use the Requests Settings method above

```
proxies = {
    'http': 'http://10.10.1.10:3128',
    'https': 'http://10.10.1.10:1080'
}
```

(continues on next page)

```
# in the Client instantiation
client = Client("api-key", "api-secret", {'proxies': proxies})
# or on an individual call
client.get_all_orders(symbol='BNBBTC', requests_params={'proxies': proxies})
```

Or set an environment variable for your proxy if required to work across all requests.

An example for Linux environments from the requests Proxies documentation is as follows.

```
$ export HTTP_PROXY="http://10.10.1.10:3128"
$ export HTTPS_PROXY="http://10.10.1.10:1080"
```

For Windows environments

```
C:\>set HTTP_PROXY=http://10.10.1.10:3128
C:\>set HTTPS_PROXY=http://10.10.1.10:1080
```

6.1.2 Binance Constants

Binance requires specific string constants for Order Types, Order Side, Time in Force, Order response and Kline intervals these are found on *binance.client.Client*.

```
SYMBOL_TYPE_SPOT = 'SPOT'
ORDER_STATUS_NEW = 'NEW'
ORDER_STATUS_PARTIALLY_FILLED = 'PARTIALLY_FILLED'
ORDER_STATUS_FILLED = 'FILLED'
ORDER_STATUS_CANCELED = 'CANCELED'
ORDER_STATUS_PENDING_CANCEL = 'PENDING_CANCEL'
ORDER_STATUS_REJECTED = 'REJECTED'
ORDER_STATUS_EXPIRED = 'EXPIRED'
KLINE_INTERVAL_1MINUTE = '1m'
KLINE_INTERVAL_3MINUTE = '3m'
KLINE_INTERVAL_5MINUTE = '5m'
KLINE_INTERVAL_15MINUTE = '15m'
KLINE_INTERVAL_30MINUTE = '30m'
KLINE_INTERVAL_1HOUR = '1h'
KLINE_INTERVAL_2HOUR = '2h'
KLINE_INTERVAL_4HOUR = '4h'
KLINE_INTERVAL_6HOUR = '6h'
KLINE_INTERVAL_8HOUR = '8h'
KLINE_INTERVAL_12HOUR = '12h'
KLINE_INTERVAL_1DAY = '1d'
KLINE_INTERVAL_3DAY = '3d'
KLINE_INTERVAL_1WEEK = '1w'
KLINE_INTERVAL_1MONTH = '1M'
SIDE BUY = 'BUY'
SIDE_SELL = 'SELL'
ORDER_TYPE_LIMIT = 'LIMIT'
ORDER_TYPE_MARKET = 'MARKET'
ORDER_TYPE_STOP_LOSS = 'STOP_LOSS'
```

(continues on next page)

```
ORDER_TYPE_STOP_LOSS_LIMIT = 'STOP_LOSS_LIMIT'
ORDER_TYPE_TAKE_PROFIT = 'TAKE_PROFIT'
ORDER_TYPE_TAKE_PROFIT_LIMIT = 'TAKE_PROFIT_LIMIT'
ORDER_TYPE_LIMIT_MAKER = 'LIMIT_MAKER'
TIME_IN_FORCE_GTC = 'GTC'
TIME_IN_FORCE_IOC = 'IOC'
TIME_IN_FORCE_FOK = 'FOK'
ORDER_RESP_TYPE_ACK = 'ACK'
ORDER_RESP_TYPE_RESULT = 'RESULT'
ORDER_RESP_TYPE_FULL = 'FULL'
# For accessing the data returned by Client.aggregate_trades().
AGG ID
                = 'a'
AGG_PRICE
                 = 'p'
AGG_QUANTITY = 'q'
AGG_FIRST_TRADE_ID = 'f'
AGG_LAST_TRADE_ID = 'l'
                  = 'T'
AGG_TIME
AGG_BUYER_MAKES
AGG_BEST_MATCH = 'M'
```

For Websocket Depth these are found on binance.websockets.BinanceSocketManager

```
WEBSOCKET_DEPTH_5 = '5'
WEBSOCKET_DEPTH_10 = '10'
WEBSOCKET_DEPTH_20 = '20'
```

To use in your code reference either binance.client.Client or binance.websockets.BinanceSocketManager

```
from binance.client import Client
from binance.websockets import BinanceSocketManager
side = Client.SIDE_BUY
```

6.1.3 General Endpoints

Ping the server

```
client.ping()
```

Get the server time

```
time_res = client.get_server_time()
```

Get system status

```
status = client.get_system_status()
```

Returns

```
{
   "status": 0,  # 0: normal1system maintenance
   "msg": "normal"  # normal or System maintenance.
}
```

Get Exchange Info

```
info = client.get_exchange_info()
```

Get Symbol Info

Get the exchange info for a particular symbol

```
info = client.get_symbol_info('BNBBTC')
```

Get All Coins Info

Get information of coins (available for deposit and withdraw) for user

```
info = client.get_all_tickers()
```

Get Get Daily Account Snapshot

Get daily account snapshot of specific type. Valid types: SPOT/MARGIN/FUTURES.

```
info = client.get_account_snapshot(type='SPOT')
```

Get Current Products

This call is deprecated, use the above Exchange Info call

```
products = client.get_products()
```

6.1.4 Market Data Endpoints

Get Market Depth

```
depth = client.get_order_book(symbol='BNBBTC')
```

Get Recent Trades

```
trades = client.get_recent_trades(symbol='BNBBTC')
```

Get Historical Trades

```
trades = client.get_historical_trades(symbol='BNBBTC')
```

Get Aggregate Trades

```
trades = client.get_aggregate_trades(symbol='BNBBTC')
```

Aggregate Trade Iterator

Iterate over aggregate trades for a symbol from a given date or a given order id.

Get Kline/Candlesticks

```
candles = client.get_klines(symbol='BNBBTC', interval=Client.KLINE_INTERVAL_30MINUTE)
```

Get Historical Kline/Candlesticks

Fetch klines for any date range and interval

Get Historical Kline/Candlesticks using a generator

Fetch klines using a generator

Get average price for a symbol

```
avg_price = client.get_avg_price(symbol='BNBBTC')
```

Get 24hr Ticker

```
tickers = client.get_ticker()
```

Get All Prices

Get last price for all markets.

```
prices = client.get_all_tickers()
```

Get Orderbook Tickers

Get first bid and ask entry in the order book for all markets.

```
tickers = client.get_orderbook_tickers()
```

6.1.5 Account Endpoints

Orders

Order Validation

Binance has a number of rules around symbol pair orders with validation on minimum price, quantity and total order value.

Read more about their specifics in the Filters section of the official API.

Read Understanding Binance Order Filters for more information about price and quantity filters on Binance.

It can be helpful to format the output using formatting

```
amount = 0.000234234
precision = 5
amt_str = "{:0.0{}f}".format(amount, precision)
```

Or if you have the tickSize or stepSize then use the helper to round to step size

```
from binance.helpers import round_step_size

amount = 0.000234234
tick_size = 0.00001
rounded_amount = round_step_size(amount, tick_size)
```

Fetch all orders

```
orders = client.get_all_orders(symbol='BNBBTC', limit=10)
```

Place an order

Place an order

Use the create_order function to have full control over creating an order

```
from binance.enums import *
order = client.create_order(
    symbol='BNBBTC',
    side=SIDE_BUY,
    type=ORDER_TYPE_LIMIT,
    timeInForce=TIME_IN_FORCE_GTC,
    quantity=100,
    price='0.00001')
```

Place a limit order

Use the helper functions to easily place a limit buy or sell order

```
order = client.order_limit_buy(
    symbol='BNBBTC',
    quantity=100,
    price='0.00001')

order = client.order_limit_sell(
    symbol='BNBBTC',
    quantity=100,
    price='0.00001')
```

Place a market order

Use the helper functions to easily place a market buy or sell order

```
order = client.order_market_buy(
    symbol='BNBBTC',
    quantity=100)

order = client.order_market_sell(
    symbol='BNBBTC',
    quantity=100)
```

Place an OCO order

Use the create_oco_order function to have full control over creating an OCO order

```
from binance.enums import *
order = client.create_oco_order(
    symbol='BNBBTC',
    side=SIDE_SELL,
    stopLimitTimeInForce=TIME_IN_FORCE_GTC,
    quantity=100,
    stopPrice='0.00001',
    price='0.00002')
```

Place a test order

Creates and validates a new order but does not send it into the exchange.

```
from binance.enums import *
order = client.create_test_order(
    symbol='BNBBTC',
    side=SIDE_BUY,
    type=ORDER_TYPE_LIMIT,
    timeInForce=TIME_IN_FORCE_GTC,
    quantity=100,
    price='0.000001')
```

Check order status

```
order = client.get_order(
    symbol='BNBBTC',
    orderId='orderId')
```

Cancel an order

```
result = client.cancel_order(
    symbol='BNBBTC',
    orderId='orderId')
```

Get all open orders

```
orders = client.get_open_orders(symbol='BNBBTC')
```

Get all orders

```
orders = client.get_all_orders(symbol='BNBBTC')
```

Account

Get account info

```
info = client.get_account()
```

Get asset balance

```
balance = client.get_asset_balance(asset='BTC')
```

Get account status

```
status = client.get_account_status()
```

Get account API trading status

```
status = client.get_account_api_trading_status()
```

Get trades

```
trades = client.get_my_trades(symbol='BNBBTC')
```

Get trade fees

```
# get fees for all symbols
fees = client.get_trade_fee()

# get fee for one symbol
fees = client.get_trade_fee(symbol='BNBBTC')
```

Get asset details

```
details = client.get_asset_details()
```

Get dust log

```
log = client.get_dust_log()
```

Transfer dust

```
transfer = client.transfer_dust(asset='BNZ')
```

Get Asset Dividend History

history = client.get_asset_dividend_history()

Disable Fast Withdraw Switch

client.disable_fast_withdraw_switch()

Enable Fast Withdraw Switch

client.enable_fast_withdraw_switch()

6.1.6 Sub Account Endpoints

Get Sub Account list

accounts = client.get_sub_account_list()

Get Sub Account Transfer History

history = client.get_sub_account_transfer_history(fromEmail='blah@gmail.com', toEmail=
 'foo@gmail.com')

Get Sub Account Assets

assets = client.get_sub_account_assets(email='blah@gmail.com')

6.1.7 Margin Trading Endpoints

Note: Cross-margin vs isolated margin trading

Binance offers both *cross-margin* trading (where all margin is in one account) and *isolated margin* trading (where each pair is a separate margin account). Make sure you are interacting with the right one.

Some of the API endpoints apply to the cross-margin or isolated margin accounts only. Other endpoints, such as the trade execution endpoints, are used for the cross-margin account trades by default, but you can use your isolated margin accounts by using the isIsolated or isolatedSymbol parameters. See the documentation below.

Market Data

Get cross-margin asset info

```
info = client.get_margin_asset(asset='BNB')
```

Get cross-margin symbol info

```
info = client.get_margin_symbol(symbol='BTCUSDT')
```

Get isolated margin symbol info

```
info = client.get_isolated_margin_symbol(symbol='BTCUSDT')
```

Get all isolated margin symbols

```
info = client.get_all_isolated_margin_symbols()
```

Get margin price index

```
info = client.get_margin_price_index(symbol='BTCUSDT')
```

Orders

Cross-margin vs isolated margin orders

By default, these trade execution endpoints will create an order using the *cross-margin* account.

To use the *isolated margin* account for the symbol you have specified, simply add the isIsolated='TRUE' parameter to the API calls below in this 'Orders' section.

Order Validation

Binance has a number of rules around symbol pair orders with validation on minimum price, quantity and total order value.

Read more about their specifics in the Filters section of the official API.

It can be helpful to format the output using the following snippet

```
amount = 0.000234234
precision = 5
amt_str = "{:0.0{}f}".format(amount, precision)
```

Fetch all margin_orders

```
orders = client.get_all_margin_orders(symbol='BNBBTC', limit=10)
```

Place a margin order

Use the create_margin_order function to have full control over creating an order

```
from binance.enums import *
order = client.create_margin_order(
    symbol='BNBBTC',
    side=SIDE_BUY,
    type=ORDER_TYPE_LIMIT,
    timeInForce=TIME_IN_FORCE_GTC,
    quantity=100,
    price='0.00001')
```

Check order status

```
order = client.get_margin_order(
    symbol='BNBBTC',
    orderId='orderId')
```

Cancel a margin order

```
result = client.cancel_margin_order(
    symbol='BNBBTC',
    orderId='orderId')
```

Get all open margin orders

```
orders = client.get_open_margin_orders(symbol='BNBBTC')
```

For isolated margin, add the isIsolated='TRUE' parameter.

Get all margin orders

```
orders = client.get_all_margin_orders(symbol='BNBBTC')
```

For isolated margin, add the isIsolated='TRUE' parameter.

Account

Get cross-margin account info

```
info = client.get_margin_account()
```

Create isolated margin account

```
account = client.create_isolated_margin_account(base='BTC', quote='ETH')
```

Get isolated margin account info

```
info = client.get_isolated_margin_account()
```

Transfer spot to cross-margin account

```
transaction = client.transfer_spot_to_margin(asset='BTC', amount='1.1')
```

Transfer cross-margin account to spot

```
transaction = client.transfer_margin_to_spot(asset='BTC', amount='1.1')
```

Transfer spot to isolated margin account

Transfer isolated margin account to spot

Get max transfer amount

```
details = client.get_max_margin_transfer(asset='BTC')
```

This max transfer is for the cross-margin account by default. For isolated margin records, add the isolatedSymbol=symbol_name parameter.

Trades

Get all margin trades

```
trades = client.get_margin_trades(symbol='BNBBTC')
```

For isolated margin trades, add the isIsolated='TRUE' parameter.

Loans

Create Ioan

```
transaction = client.create_margin_loan(asset='BTC', amount='1.1')
```

This for the cross-margin account by default. For isolated margin, add the isIsolated='TRUE' and the symbol=symbol_name parameters.

Repay Ioan

```
transaction = client.repay_margin_loan(asset='BTC', amount='1.1')
```

This for the cross-margin account by default. For isolated margin, add the isIsolated='TRUE' and the symbol=symbol_name parameters.

Get loan details

```
details = client.get_margin_loan_details(asset='BTC', txId='100001')
```

This for the cross-margin account by default. For isolated margin records, add the isolatedSymbol=symbol_name parameter.

Get repay details

```
details = client.get_margin_repay_details(asset='BTC', txId='100001')
```

This for the cross-margin account by default. For isolated margin records, add the isolatedSymbol=symbol_name parameter.

Get max loan amount

```
details = client.get_max_margin_loan(asset='BTC')
```

The max loan is for the cross-margin account by default. For isolated margin records, add the isolatedSymbol=symbol_name parameter.

6.1.8 Websockets

There are 2 ways to interact with websockets.

with ThreadedWebsocketManager or BinanceSocketManager.

ThreadedWebsocketManager does not require asyncio programming, while BinanceSocketManager does.

ThreadedWebsocketManager function being with *start_*, e.g *start_ticker_socket* while BinanceSocketManager is simple *ticker_socket*

Multiple socket connections can be made through either manager.

Only one instance of each socket type will be created, i.e. only one BNBBTC Depth socket can be created and there can be both a BNBBTC Depth and a BNBBTC Trade socket open at once.

Messages are received as dictionary objects relating to the message formats defined in the Binance WebSocket API documentation.

Websockets are setup to reconnect with a maximum of 5 retries with an exponential backoff strategy.

ThreadedWebsocketManager Websocket Usage

Starting sockets on the ThreadedWebsocketManager requires a callback parameter, similar to old implementations of websockets on python-binance

ThreadedWebsocketManager takes similar parameters to the Client class as it creates an AsyncClient internally.

For authenticated streams api_key and api_stream are required.

As these use threads *start()* is required to be called before starting any sockets.

```
from binance import ThreadedWebsocketManager
api_key = '<api_key'>
api_secret = '<api_secret'>
def main():
    symbol = 'BNBBTC'
    twm = ThreadedWebsocketManager(api_key=api_key, api_secret=api_secret)
    # start is required to initialise its internal loop
   twm.start()
   def handle_socket_message(msg):
       print(f"message type: {msg['e']}")
       print (msg)
   twm.start_kline_socket(callback=handle_socket_message, symbol=symbol)
    # multiple sockets can be started
   twm.start_depth_socket(callback=handle_socket_message, symbol=symbol)
    # or a multiplex socket can be started like this
    # see Binance docs for stream names
    streams = ['BNBBTC@miniTicker', 'BNBBTC@bookTicker']
    twm.start_multiplex_socket(callback=handle_socket_message, streams=streams)
```

(continues on next page)

```
if __name__ == "__main__":
    main()
```

Stop Individual Stream

When starting a stream, a name for that stream will be returned. This can be used to stop that individual stream

```
from binance import ThreadedWebsocketManager

symbol = 'BNBBTC'

twm = ThreadedWebsocketManager()
# start is required to initialise its internal loop
twm.start()

def handle_socket_message(msg):
    print(f"message type: {msg['e']}")
    print(msg)

    twm.start_kline_socket(callback=handle_socket_message, symbol=symbol)
depth_stream_name = twm.start_depth_socket(callback=handle_socket_message,
    symbol=symbol)

# some time later

twm.stop_socket(depth_stream_name)
```

Stop All Streams

Attempting to start a stream after *stop* is called will not work.

BinanceSocketManager Websocket Usage

Create the manager like so, passing an AsyncClient.

```
import asyncio
from binance import AsyncClient, BinanceSocketManager

async def main():
    client = await AsyncClient.create()
```

(continues on next page)

```
bm = BinanceSocketManager(client)
# start any sockets here, i.e a trade socket
ts = bm.trade_socket('BNBBTC')
# then start receiving messages
async with ts as tscm:
    while True:
        res = await tscm.recv()
        print(res)

await client.close_connection()

if __name__ == "__main__":
    loop = asyncio.get_event_loop()
    loop.run_until_complete(main())
```

Set a custom timeout for the websocket connections

```
# set a timeout of 60 seconds
bm = BinanceSocketManager(client, user_timeout=60)
```

Manually enter and exit the Asynchronous context manager

```
ts = bm.trade_socket('BNBBTC')
# enter the context manager
await ts.__aenter__()
# receive a message
msg = await ts.recv()
print(msg)
# exit the context manager
await ts.__aexit__(None, None, None)
```

Using a different TLD

The ThreadedWebsocketManager can take the tld when created if required.

```
from binance.streams import ThreadedWebsocketManager
twm = ThreadedWebsocketManager(tld='us')
```

The BinanceSocketManager uses the same tld value as the AsyncClient that is passed in. To use the 'us' tld we can do this.

```
from binance import AsyncClient, BinanceSocketManager

async def x():
    client = await AsyncClient.create(tld='us')
    bm = BinanceSocketManager(client)

# start a socket...

await client.close_connection()
```

Websocket Errors

If the websocket is disconnected and is unable to reconnect a message is sent to the callback to indicate this. The format is

```
{
    'e': 'error',
    'm': 'Max reconnect retries reached'
}

# check for it like so

def process_message(msg):
    if msg['e'] == 'error':
        # close and restart the socket
    else:
        # process message normally
```

Multiplex Socket

Create a socket combining multiple streams.

These streams can include the depth, kline, ticker and trade streams but not the user stream which requires extra authentication.

Symbols in socket name must be lowercase i.e bnbbtc@aggTrade, neobtc@ticker

See the Binance Websocket Streams API documentation for details on socket names.

```
# pass a list of stream names
ms = bm.multiplex_socket(['bnbbtc@aggTrade', 'neobtc@ticker'])
```

Depth Socket

Depth sockets have an optional depth parameter to receive partial book rather than a diff response. By default this the diff response is returned. Valid depth values are 5, 10 and 20 and defined as enums.

```
# depth diff response
ds = bm.depth_socket('BNBBTC')

# partial book response
ds = bm.depth_socket('BNBBTC', depth=BinanceSocketManager.WEBSOCKET_DEPTH_5)
```

Kline Socket

Kline sockets have an optional interval parameter. By default this is set to 1 minute. Valid interval values are defined as enums.

```
from binance.enums import *
ks = bm.kline_socket('BNBBTC', interval=KLINE_INTERVAL_30MINUTE)
```

Aggregated Trade Socket

```
ats = bm.aggtrade_socket('BNBBTC')
```

Trade Socket

```
ts = bm.trade_socket('BNBBTC')
```

Symbol Ticker Socket

```
sts = bm.symbol_ticker_socket('BNBBTC')
```

Ticker Socket

```
ts = bm.ticker_socket(process_message)
```

Mini Ticker Socket

```
# by default updates every second
mts = bm.miniticker_socket()

# this socket can take an update interval parameter
# set as 5000 to receive updates every 5 seconds
mts = bm.miniticker_socket(5000)
```

User Socket

This watches for 3 different user events

- Account Update Event
- Order Update Event
- Trade Update Event

The Manager handles keeping the socket alive.

There are separate sockets for Spot, Cross-margin and separate Isolated margin accounts.

Spot trading

```
bm.user_socket()
```

Cross-margin

```
bm.margin_socket()
```

Isolated margin

```
bm.isolated_margin_socket(symbol)
```

6.1.9 Depth Cache

To follow the depth cache updates for a symbol there are 2 options similar to websockets.

Use the DepthCacheManager (or OptionsDepthCacheManager for vanilla options) or use the ThreadedDepthCacheManager if you don't want to interact with asyncio.

ThreadedDepthCacheManager Websocket Usage

Starting sockets on the ThreadedDepthCacheManager requires a callback parameter, similar to old implementations of depth cache on python-binance pre v1

ThreadedDepthCacheManager takes similar parameters to the Client class as it creates an AsyncClient internally.

As these use threads *start()* is required to be called before starting any depth cache streams.

```
from binance import ThreadedDepthCacheManager
def main():
    dcm = ThreadedDepthCacheManager()
    # start is required to initialise its internal loop
   dcm.start()
    def handle_depth_cache(depth_cache):
        print(f"symbol {depth_cache.symbol}")
        print("top 5 bids")
        print (depth_cache.get_bids()[:5])
        print("top 5 asks")
        print (depth_cache.get_asks()[:5])
        print("last update time {}".format(depth_cache.update_time))
    dcm_name = dcm.start_depth_cache(handle_depth_cache, symbol='BNBBTC')
    # multiple depth caches can be started
    dcm_name = dcm.start_depth_cache(handle_depth_cache, symbol='ETHBTC')
if __name__ == "__main__":
   main()
```

Stop Individual Depth Cache

When starting a stream, a name for that stream will be returned. This can be used to stop that individual stream

```
from binance import ThreadedDepthCacheManager

symbol = 'BNBBTC'

dcm = ThreadedDepthCacheManager()
 dcm.start()

def handle_depth_cache(depth_cache):
    print(f"message type: {msg['e']}")
    print(msg)

dcm_name = dcm.start_depth_cache(handle_depth_cache, symbol='BNBBTC')

# some time later

dcm.stop_socket(dcm_name)
```

Stop All Depth Cache streams

```
from binance import ThreadedDepthCacheManager

symbol = 'BNBBTC'

dcm = ThreadedDepthCacheManager()
 dcm.start()

def handle_depth_cache(depth_cache):
    print(f"message type: {msg['e']}")
    print(msg)

dcm_name = dcm.start_depth_cache(handle_depth_cache, symbol='BNBBTC')

# some time later

dcm.stop()
```

Attempting to start a stream after *stop* is called will not work.

DepthCacheManager or OptionsDepthCacheManager Usage

Create the manager like so, passing the async api client, symbol and an optional callback function.

(continues on next page)

(continued from previous page)

```
print(depth_cache.get_bids()[:5])
    print("top 5 asks")
    print(depth_cache.get_asks()[:5])
    print("last update time {}".format(depth_cache.update_time))

if __name__ == "__main__":
    loop = asyncio.get_event_loop()
    loop.run_until_complete(main())
```

The *DepthCacheManager* returns an Asynchronous Context Manager which can be used with *async for* or by interacting with the __aenter__ and __aexit__ functions

By default the depth cache will fetch the order book via REST request every 30 minutes. This duration can be changed by using the *refresh_interval* parameter. To disable the refresh pass 0 or None. The socket connection will stay open receiving updates to be replayed once the full order book is received.

Share a Socket Manager

Here dcm1 and dcm2 share the same instance of BinanceSocketManager

```
from binance.websockets import BinanceSocketManager
from binance.depthcache import DepthCacheManager
bm = BinanceSocketManager(client)
dcm1 = DepthCacheManager(client, 'BNBBTC', bm=bm)
dcm2 = DepthCacheManager(client, 'ETHBTC', bm=bm)
```

Websocket Errors

If the underlying websocket is disconnected and is unable to reconnect None is returned for the depth_cache parameter.

Examples

```
# 1 hour interval refresh
dcm = DepthCacheManager(client, 'BNBBTC', refresh_interval=60*60)
# disable refreshing
dcm = DepthCacheManager(client, 'BNBBTC', refresh_interval=0)
```

```
async with dcm as dcm_socket:
    while True:
        depth_cache = await dcm_socket.recv()
        print("symbol {}".format(depth_cache.symbol))
        print("top 5 bids")
        print(depth_cache.get_bids()[:5])
        print("top 5 asks")
        print(depth_cache.get_asks()[:5])
        print("last update time {}".format(depth_cache.update_time))
```

To use the magic <u>__aenter__</u> and <u>__aexit__</u> functions to use this class without the async with

```
dcm = DepthCacheManager(client, 'BNBBTC')

await dcm.__aenter__()
depth_cache = await dcm.recv()
print("symbol {}".format(depth_cache.symbol))
print("top 5 bids")
print(depth_cache.get_bids()[:5])
print("top 5 asks")
print(depth_cache.get_asks()[:5])
print("last update time {}".format(depth_cache.update_time))

# exit the context manager
await dcm.__aexit__(None, None, None)
```

6.1.10 Withdraw Endpoints

Place a withdrawal

Make sure you enable Withdrawal permissions for your API Key to use this call.

You must have withdrawn to the address through the website and approved the withdrawal via email before you can withdraw using the API.

Raises a BinanceWithdrawException if the withdraw fails.

```
from binance.exceptions import BinanceAPIException, BinanceWithdrawException
try:
    # name parameter will be set to the asset value by the client if not passed
    result = client.withdraw(
        coin='ETH',
        address='<eth_address>',
        amount=100)
except BinanceAPIException as e:
   print(e)
except BinanceWithdrawException as e:
   print(e)
else:
    print("Success")
# passing a name parameter
result = client.withdraw(
   coin='ETH',
   address='<eth_address>',
   amount=100,
   name='Withdraw')
# if the coin requires a extra tag or name such as XRP or XMR then pass and
→ `addressTag` parameter.
result = client.withdraw(
   coin='XRP',
   address='<xrp_address>',
   addressTag='<xrp_address_tag>',
   amount=10000)
```

Fetch deposit history

```
deposits = client.get_deposit_history()
btc_deposits = client.get_deposit_history(coin='BTC')
```

Fetch withdraw history

```
withdraws = client.get_withdraw_history()
btc_withdraws = client.get_withdraw_history(coin='BTC')
```

Get deposit address

```
address = client.get_deposit_address(coin='BTC')
```

6.1.11 Helper Functions

```
binance.helpers
alias of binance.helpers
```

6.1.12 Exceptions

BinanceRequestException

Raised if a non JSON response is returned

BinanceAPIException

On an API call error a binance.exceptions.BinanceAPIException will be raised.

The exception provides access to the

- status_code response status code
- response response object
- code Binance error code
- message Binance error message
- request request object if available

```
try:
    client.get_all_orders()
except BinanceAPIException as e:
    print e.status_code
    print e.message
```

6.1.13 FAQ

Q: Why do I get "Timestamp for this request is not valid"

A: This occurs in 2 different cases.

The timestamp sent is outside of the serverTime - recvWindow value The timestamp sent is more than 1000ms ahead of the server time

Check that your system time is in sync. See this issue for some sample code to check the difference between your local time and the Binance server time.

Q: Why do I get "Signature for this request is not valid"

A1: One of your parameters may not be in the correct format.

Check recvWindow is an integer and not a string.

A2: You may need to regenerate your API Key and Secret

A3: You may be attempting to access the API from a Chinese IP address, these are now restricted by Binance.

6.1.14 Changelog

v1.0.10 - 2021-05-13

Added

- · futures multi-asset margin mode endpoints
- optional symbol param to get_all_tickers

Fixed

• start_multiplex_socket remove lower case filter on stream names

v1.0.9 - 2021-05-12

Fixed

• start_book_ticker_socket and start_multiplex_socket to call correct async function

v1.0.8 - 2021-05-11

Added

old style websocket and depth cache managers as option without interacting with asyncio

Fixed

- fixed issue with get_historical_klines in Client
- remove print debug line

v1.0.7

Fixed

• remove version param from get_sub_account_assets

v1.0.6

Fixed

• fix time for authenticated stream keepalive

v1.0.5

Fixed

• Restored access to last response on client

v1.0.4

Added

- Futures Testnet support
- Kline type for fetching historical klines

Fixed

• Spot Testnet websocket URL

v1.0.3

Added

• Spot Testnet support

v1.0.2

Added

• start of typing to client and websockets

Fixed

- end_str, limit, spot params in kline fetching
- drop None values in params passed

Updated

• more examples in docs

v1.0.1

Fixed

• restored params for Client and AsyncClient classes

v1.0.0

Added

- · Async support for all REST endpoints
- USD-M and Coin-M Futures websocket streams
- · Websockets use same tld as Client
- convert type option for DepthCache

Breaking Changes

- Supports only py3.6+
- · All wapi calls changed to sapi
- · Websockets have changed to use Asynchronous context managers

Fixed

• get_historical_klines params

v0.7.11

Added - Vanilla Options REST endpoints - Vanilla Options websockets - Futures order type enums

Updated

- websocket keep-alive functions for different socket types
- · dependencies

Fixed

• change to User-Agent to avoid connection issues

v0.7.5.dev

Changed - Stock json lib to ujson (https://github.com/sammchardy/python-binance/pull/383)

v0.7.5 - 2020-02-06

Added

- Futures REST endpoints
- Lending REST endpoints
- $\bullet \ \ {\sf OCO\ Orders\ function}\ {\it create_oco_order}, {\it order_oco_buy}, {\it order_oco_sell}$
- Average Price function get_avg_price
- Support for other domains (.us, .jp, etc)

Updated

• dependencies

Fixed

· websocket keepalive callback not found

v0.7.4 - 2019-09-22

Added

- · symbol book ticker websocket streams
- · margin websocket stream

Updated

- can call Client without any params
- make response a property of the Client class so you can access response properties after a request

Fixed

• issue with None value params causing errors

v0.7.3 - 2019-08-12

Added

- sub account endpoints
- · dust transfer endpoint
- asset divident history endpoint

Removed

· deprecated withdraw fee endpoint

v0.7.2 - 2019-08-01

Added

· margin trading endpoints

Fixed

· depth cache clearing bug

v0.7.1 - 2019-01-23

Added

- limit param to DepthCacheManager
- limit param to get_historical_klines
- update_time to DepthCache class

Updated

· test coverage

Fixed

- super init in Websocket class
- · removal of request params from signature
- empty set issue in aggregate_trade_iter

v0.7.0 - 2018-08-08

Added

- · get_asset_details endpoint
- · get_dust_log endpoint
- get_trade_fee endpoint
- ability for multiple DepthCacheManagers to share a BinanceSocketManager
- get_historial_klines_generator function
- custom socket timeout param for BinanceSocketManager

Updated

- general dependency version
- removed support for python3.3

Fixed

• add a super init on BinanceClientProtocol

v0.6.9 - 2018-04-27

Added

- timestamp in milliseconds to get_historical_klines function
- timestamp in milliseconds to aggregate_trade_iter function

Fixed

• Don't close user stream listen key on socket close

v0.6.8 - 2018-03-29

Added

• get_withdraw_fee function

Fixed

- Remove unused LISTENKEY_NOT_EXISTS
- Optimise the historical klines function to reduce requests
- Issue with end_time in aggregate trade iterator

v0.6.7 - 2018-03-14

Fixed

- Issue with get_historical_klines when response had exactly 500 results
- $\bullet \ \ Changed \ Binance Response Exception \ to \ Binance Request Exception$
- Set default code value in BinanceApiException properly

v0.6.6 - 2018-02-17

Fixed

· User stream websocket keep alive strategy updated

v0.6.5 - 2018-02-13

Fixed

• get_historical_klines response for month interval

v0.6.4 - 2018-02-09

Added

• system status endpoint get_system_status

v0.6.3 - 2018-01-29

Added

- mini ticker socket function start_miniticker_socket
- aggregate trade iterator aggregate_trade_iter

Fixes

- clean up interval_to_milliseconds logic
- general doc and file cleanups

v0.6.2 - 2018-01-12

Fixes

• fixed handling Binance errors that aren't JSON objects

v0.6.1 - 2018-01-10

Fixes

- · added missing dateparser dependency to setup.py
- · documentation fixes

v0.6.0 - 2018-01-09

New version because why not.

Added

- get_historical_klines function to fetch klines for any date range
- · ability to override requests parameters globally
- · error on websocket disconnect

· example related to blog post

Fixes

· documentation fixes

v0.5.17 - 2018-01-08

Added

· check for name parameter in withdraw, set to asset parameter if not passed

Update

· Windows install error documentation

Removed

• reference to disable_validation in documentation

v0.5.16 - 2018-01-06

Added

- · addressTag documentation to withdraw function
- documentation about requests proxy environment variables

Update

- FAQ for signature error with solution to regenerate API key
- change create_order to create_test_order in example

Fixed

• reference to BinanceAPIException in documentation

v0.5.15 - 2018-01-03

Fixed

• removed all references to WEBSOCKET_DEPTH_1 enum

v0.5.14 - 2018-01-02

Added

- · Wait for depth cache socket to start
- · check for sequential depth cache messages

Updated

• documentation around depth websocket and diff and partial responses

Removed

- Removed unused WEBSOCKET_DEPTH_1 enum
- · removed unused libraries and imports

v0.5.13 - 2018-01-01

Fixed

• Signature invalid error

v0.5.12 - 2017-12-29

Added

• get_asset_balance helper function to fetch an individual asset's balance

Fixed

- added timeout to requests call to prevent hanging
- changed variable type to str for price parameter when creating an order
- · documentation fixes

v0.5.11 - 2017-12-28

Added

• refresh interval parameter to depth cache to keep it fresh, set default at 30 minutes

Fixed

• watch depth cache socket before fetching order book to replay any messages

v0.5.10 - 2017-12-28

Updated

• updated dependencies certifi and cryptography to help resolve signature error

v0.5.9 - 2017-12-26

Fixed

· fixed websocket reconnecting, was no distinction between manual close or network error

v0.5.8 - 2017-12-25

Changed

- · change symbol parameter to optional for get_open_orders function
- added listenKey parameter to stream_close function

Added

• get_account_status function that was missed

v0.5.7 - 2017-12-24

Changed

· change depth cache callback parameter to optional

Added

• note about stopping Twisted reactor loop to exit program

v0.5.6 - 2017-12-20

Added

• get_symbol_info function to simplify getting info about a particular symbol

v0.5.5 - 2017-12-19

Changed

• Increased default limit for order book on depth cache from 10 to 500

v0.5.4 - 2017-12-14

Added

• symbol property made public on DepthCache class

Changed

· Enums now also accessible from binance.client.Client and binance.websockets.BinanceSocketManager

v0.5.3 - 2017-12-09

Changed

- User stream refresh timeout from 50 minutes to 30 minutes
- · User stream socket listen key change check simplified

v0.5.2 - 2017-12-08

Added

• start_multiplex_socket function to BinanceSocketManager to create multiplexed streams

v0.5.1 - 2017-12-06

Added

• Close method for DepthCacheManager

Fixes

• Fixed modifying array error message when closing the BinanceSocketManager

v0.5.0 - 2017-12-05

Updating to match new API documentation

Added

- · Recent trades endpoint
- · Historical trades endpoint
- Order response type option
- Check for invalid user stream listen key in socket to keep connected

Fixes

• Fixed exchange info endpoint as it was renamed slightly

v0.4.3 - 2017-12-04

Fixes

- Fixed stopping sockets where they were reconnecting
- Fixed websockets unable to be restarted after close
- · Exception in parsing non-JSON websocket message

v0.4.2 - 2017-11-30

Removed

• Removed websocket update time as 0ms option is not available

v0.4.1 - 2017-11-24

Added

• Reconnecting websockets, automatic retry on disconnect

v0.4.0 - 2017-11-19

Added

- · Get deposit address endpoint
- Upgraded withdraw endpoints to v3
- · New exchange info endpoint with rate limits and full symbol info

Removed

• Order validation to return at a later date

v0.3.8 - 2017-11-17

Fixes

- Fix order validation for market orders
- WEBSOCKET_DEPTH_20 value, 20 instead of 5
- · General tidy up

v0.3.7 - 2017-11-16

Fixes

• Fix multiple depth caches sharing a cache by initialising bid and ask objects each time

v0.3.6 - 2017-11-15

Fixes

· check if Reactor is already running

v0.3.5 - 2017-11-06

Added

• support for BNB market

Fixes

• fixed error if new market type is created that we don't know about

v0.3.4 - 2017-10-31

Added

- depth parameter to depth socket
- interval parameter to kline socket
- update time parameter for compatible sockets
- · new enums for socket depth and update time values
- better websocket documentation

Changed

- Depth Cache Manager uses 0ms socket update time
- connection key returned when creating socket, this key is then used to stop it

Fixes

· General fixes

v0.3.3 - 2017-10-31

Fixes

• Fixes for broken tests

v0.3.2 - 2017-10-30

Added

• More test coverage of requests

Fixes

• Order quantity validation fix

v0.3.1 - 2017-10-29

Added

• Withdraw exception handler with translation of obscure error

Fixes

· Validation fixes

v0.3.0 - 2017-10-29

Added

- · Withdraw endpoints
- Order helper functions

v0.2.0 - 2017-10-27

Added

• Symbol Depth Cache

v0.1.6 - 2017-10-25

Changes

- Upgrade to v3 signed endpoints
- Update function documentation

v0.1.5 - 2017-09-12

Changes

- Added get_all_tickers call
- Added get_orderbook_tickers call
- Added some FAQs

Fixes

• Fix error in enum value

v0.1.4 - 2017-09-06

Changes

• Added parameter to disable client side order validation

v0.1.3 - 2017-08-26

Changes

• Updated documentation

Fixes

• Small bugfix

v0.1.2 - 2017-08-25

Added

• Travis.CI and Coveralls support

Changes

• Validation for pairs using public endpoint

v0.1.1 - 2017-08-17

Added

• Validation for HSR/BTC pair

v0.1.0 - 2017-08-16

Websocket release

Added

- Websocket manager
- Order parameter validation
- Order and Symbol enums
- API Endpoints for Data Streams

v0.0.2 - 2017-08-14

Initial version

Added

• General, Market Data and Account endpoints

6.1.15 Binance API

client module

Parameters

Binance API Client constructor

- api_key(str.)-Api Key
- api_secret (str.) Api Secret
- requests_params (dict.) optional Dictionary of requests params to use for all calls
- testnet (bool) Use testnet environment only available for vanilla options at the moment

```
aggregate_trade_iter (symbol, start_str=None, last_id=None)
```

Iterate over aggregate trade data from (start time or last id) to the end of the history so far.

If start_time is specified, start with the first trade after start_time. Meant to initialise a local cache of trade data.

If last_id is specified, start with the trade after it. This is meant for updating a pre-existing local trade data cache.

Only allows start_str or last_id—not both. Not guaranteed to work right if you're running more than one of these simultaneously. You will probably hit your rate limit.

See dateparser docs for valid start and end string formats http://dateparser.readthedocs.io/en/latest/

If using offset strings for dates add "UTC" to date string e.g. "now UTC", "11 hours ago UTC"

Parameters

- symbol (str) Symbol string e.g. ETHBTC
- **start_str** Start date string in UTC format or timestamp in milliseconds. The iterator will

return the first trade occurring later than this time. :type start_str: strlint :param last_id: aggregate trade ID of the last known aggregate trade. Not a regular trade ID. See https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#compressedaggregate-trades-list.

Returns an iterator of JSON objects, one per trade. The format of each object is identical to Client.aggregate_trades().

```
cancel_margin_order(**params)
cancel_order(**params)
```

Cancel an active order. Either orderId or origClientOrderId must be sent.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#cancel-order-trade

Parameters

- symbol (str) required
- orderId (int) The unique order id
- origClientOrderId(str) optional
- **newClientOrderId** (*str*) Used to uniquely identify this cancel. Automatically generated by default.
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

```
"symbol": "LTCBTC",
   "origClientOrderId": "myOrder1",
   "orderId": 1,
   "clientOrderId": "cancelMyOrder1"
}
```

Raises BinanceRequestException, BinanceAPIException

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#new-oco-trade

Parameters

- symbol(str) required
- **listClientOrderId** (*str*) A unique id for the list order. Automatically generated if not sent.
- **side** (str) required
- quantity (decimal) required
- **limitClientOrderId** (str) A unique id for the limit order. Automatically generated if not sent.
- **price** (str) required
- limitIcebergQty (decimal) Used to make the LIMIT_MAKER leg an iceberg order
- **stopClientOrderId** (*str*) A unique id for the stop order. Automatically generated if not sent.
- stopPrice (str) required
- **stopLimitPrice** (*str*) If provided, stopLimitTimeInForce is required.

- **stopIcebergQty** (decimal) Used with STOP_LOSS_LIMIT leg to make an iceberg order.
- stopLimitTimeInForce (str) Valid values are GTC/FOK/IOC.
- newOrderRespType (str) Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

Response ACK:

```
Response RESULT:

{
}

Response FULL:

{
}
```

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

create_order(**params)

Send in a new order

Any order with an icebergQty MUST have timeInForce set to GTC.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#new-order-trade

Parameters

- **symbol** (str) required
- side (str) required
- type (str) required
- timeInForce (str) required if limit order
- quantity (decimal) required
- **quoteOrderQty** (decimal) amount the user wants to spend (when buying) or receive (when selling) of the quote asset, applicable to MARKET orders
- price(str) required
- newClientOrderId (str) A unique id for the order. Automatically generated if not sent.
- icebergQty (decimal) Used with LIMIT, STOP_LOSS_LIMIT, and TAKE_PROFIT_LIMIT to create an iceberg order.
- newOrderRespType (str) Set the response JSON. ACK, RESULT, or FULL; default: RESULT.

• recvWindow (int) – the number of milliseconds the request is valid for

Returns API response

Response ACK:

```
{
    "symbol":"LTCBTC",
    "orderId": 1,
    "clientOrderId": "myOrder1" # Will be newClientOrderId
    "transactTime": 1499827319559
}
```

Response RESULT:

```
"symbol": "BTCUSDT",
"orderId": 28,
"clientOrderId": "6gCrw2kRUAF9CvJDGP16IP",
"transactTime": 1507725176595,
"price": "0.000000000",
"origQty": "10.000000000",
"executedQty": "10.000000000",
"status": "FILLED",
"timeInForce": "GTC",
"type": "MARKET",
"side": "SELL"
}
```

Response FULL:

```
"symbol": "BTCUSDT",
"orderId": 28,
"clientOrderId": "6qCrw2kRUAF9CvJDGP16IP",
"transactTime": 1507725176595,
"price": "0.00000000",
"origQty": "10.00000000",
"executedQty": "10.00000000",
"status": "FILLED",
"timeInForce": "GTC",
"type": "MARKET",
"side": "SELL",
"fills": [
        "price": "4000.00000000",
        "qty": "1.00000000",
        "commission": "4.00000000",
        "commissionAsset": "USDT"
        "price": "3999.00000000",
        "qty": "5.00000000",
        "commission": "19.99500000",
        "commissionAsset": "USDT"
    },
        "price": "3998.00000000",
        "qty": "2.00000000",
```

(continues on next page)

(continued from previous page)

```
"commission": "7.99600000",
    "commissionAsset": "USDT"

},

{
    "price": "3997.000000000",
    "qty": "1.00000000",
    "commission": "3.99700000",
    "commissionAsset": "USDT"

},

{
    "price": "3995.000000000",
    "qty": "1.00000000",
    "qty": "1.00000000",
    "commission": "3.99500000",
    "commissionAsset": "USDT"

}

]
```

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

```
create_sub_account_futures_transfer(**params)
```

```
create_test_order(**params)
```

Test new order creation and signature/recvWindow long. Creates and validates a new order but does not send it into the matching engine.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#test-new-order-trade

Parameters

- **symbol** (str) required
- side (str) required
- type (str) required
- timeInForce (str) required if limit order
- quantity (decimal) required
- price (str) required
- newClientOrderId (str) A unique id for the order. Automatically generated if not sent.
- icebergQty (decimal) Used with iceberg orders
- newOrderRespType (str) Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- recvWindow (int) The number of milliseconds the request is valid for

Returns API response

```
{}
```

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

]
```

Raises BinanceRequestException, BinanceAPIException

get_account_api_trading_status(**params)

Fetch account api trading status detail.

https://binance-docs.github.io/apidocs/spot/en/#account-api-trading-status-sapi-user_data

Parameters recvWindow (int) - the number of milliseconds the request is valid for

Returns API response

```
"data": {
                        // API trading status detail
        "isLocked": false, // API trading function is locked or not
        "plannedRecoverTime": 0, // If API trading function is locked, this,
\hookrightarrow is the planned recover time
        "triggerCondition": {
                "GCR": 150, // Number of GTC orders

    "t": 0.99
}

}

plupdateTime": 1547630471725
}
```

Raises BinanceWithdrawException

```
get_account_snapshot (**params)
```

get_account_status (**params)

Get account status detail.

https://binance-docs.github.io/apidocs/spot/en/#account-status-sapi-user_data

Parameters recvWindow (int) – the number of milliseconds the request is valid for

Returns API response

```
{
    "data": "Normal"
}
```

Raises BinanceWithdrawException

```
\texttt{get\_aggregate\_trades} (**params) \rightarrow Dict[KT, VT]
```

Get compressed, aggregate trades. Trades that fill at the time, from the same order, with the same price will have the quantity aggregated.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md# compressedaggregate-trades-list

Parameters

- **symbol** (str) required
- **fromId** (str) ID to get aggregate trades from INCLUSIVE.
- **startTime** (*int*) Timestamp in ms to get aggregate trades from INCLUSIVE.
- **endTime** (*int*) Timestamp in ms to get aggregate trades until INCLUSIVE.
- limit (int) Default 500; max 500.

Returns API response

Raises BinanceRequestException, BinanceAPIException

```
get_all_coins_info(**params)
get_all_isolated_margin_symbols(**params)
get_all_margin_orders(**params)
get_all_orders(**params)
   Get all account orders; active, canceled, or filled.
```

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#all-orders-user data

Parameters

- **symbol** (str) required
- orderId (int) The unique order id
- limit (int) Default 500; max 500.
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

```
[
    "symbol": "LTCBTC",
    "orderId": 1,
    "clientOrderId": "myOrder1",
    "price": "0.1",
    "origQty": "1.0",
    "executedQty": "0.0",
    "status": "NEW",
    "timeInForce": "GTC",
    "type": "LIMIT",
    "side": "BUY",
    "stopPrice": "0.0",
    "icebergQty": "0.0",
    "time": 1499827319559
}
]
```

Raises BinanceRequestException, BinanceAPIException

```
\texttt{get\_all\_tickers} (symbol: Optional[str] = None) \rightarrow Dict[KT, VT] Latest price for a symbol or symbols.
```

https://binance-docs.github.io/apidocs/spot/en/#symbol-price-ticker

Parameters symbol (str) – optional

Returns List of market tickers

Raises BinanceRequestException, BinanceAPIException

get_asset_balance (asset, **params)

Get current asset balance.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#account-information-user_data

Parameters

- asset (str) required
- recvWindow (int) the number of milliseconds the request is valid for

Returns dictionary or None if not found

```
{
   "asset": "BTC",
   "free": "4723846.89208129",
   "locked": "0.00000000"
}
```

Raises BinanceRequestException, BinanceAPIException

get_asset_details(**params)

Fetch details on assets.

https://binance-docs.github.io/apidocs/spot/en/#asset-detail-sapi-user_data

Parameters

- asset (str) optional
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

```
{
    "CTR": {
        "minWithdrawAmount": "70.00000000", //min withdraw amount
        "depositStatus": false,//deposit status (false if ALL of networks

→' are false)
    "withdrawFee": 35, // withdraw fee
```

(continues on next page)

(continued from previous page)

```
"withdrawStatus": true, //withdraw status (false if ALL of_
onetworks' are false)
    "depositTip": "Delisted, Deposit Suspended" //reason
},
    "SKY": {
        "minWithdrawAmount": "0.02000000",
        "depositStatus": true,
        "withdrawFee": 0.01,
        "withdrawStatus": true
}
```

Raises BinanceWithdrawException

get_asset_dividend_history(**params)

Query asset dividend record.

https://binance-docs.github.io/apidocs/spot/en/#asset-dividend-record-user_data

Parameters

- asset (str) optional
- startTime (long) optional
- endTime (long) optional
- recvWindow (int) the number of milliseconds the request is valid for

```
result = client.get_asset_dividend_history()
```

Returns API response

```
"rows":[
    {
        "amount": "10.00000000",
        "asset": "BHFT",
        "divTime":1563189166000,
        "enInfo": "BHFT distribution",
        "tranId":2968885920
    },
        "amount": "10.00000000",
        "asset": "BHFT",
        "divTime":1563189165000,
        "enInfo": "BHFT distribution",
        "tranId":2968885920
    }
],
"total":2
```

Raises BinanceRequestException, BinanceAPIException

```
get_avg_price (**params)
Current average price for a symbol.
```

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#current-average-price

```
Parameters symbol (str) -
```

Returns API response

```
{
    "mins": 5,
    "price": "9.35751834"
}
```

```
get_bnb_burn_spot_margin(**params)
```

```
get_deposit_address (coin: str, network: Optional[str] = None, **params)
```

Fetch a deposit address for a symbol

https://binance-docs.github.io/apidocs/spot/en/#deposit-address-supporting-network-user_data

Parameters

- coin (str) required
- network (str) optional
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

```
{

```

Raises BinanceRequestException, BinanceAPIException

```
get_deposit_history(**params)
```

Fetch deposit history.

https://binance-docs.github.io/apidocs/spot/en/#deposit-history-supporting-network-user_data

Parameters

- coin (str) optional
- startTime (long) optional
- endTime (long) optional
- offset (long) optional default:0
- limit (long) optional
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

Raises BinanceRequestException, BinanceAPIException

- symbol (str) Name of symbol pair e.g BNBBTC
- interval (str) Binance Kline interval

- start_str(str/int) Start date string in UTC format or timestamp in milliseconds
- **end_str** (*str|int*) optional end date string in UTC format or timestamp in milliseconds (default will fetch everything up to now)
- limit (int) Default 500; max 1000.
- klines_type (HistoricalKlinesType) Historical klines type: SPOT or FU-TURES

Returns list of OHLCV values

Get Historical Klines generator from Binance

Parameters

- **symbol** (str) Name of symbol pair e.g BNBBTC
- interval (str) Binance Kline interval
- start_str(str/int) Start date string in UTC format or timestamp in milliseconds
- end_str (str/int) optional end date string in UTC format or timestamp in milliseconds (default will fetch everything up to now)
- klines_type (HistoricalKlinesType) Historical klines type: SPOT or FU-TURES

Returns generator of OHLCV values

```
\begin{tabular}{ll} {\tt get\_historical\_trades} (**params) &\to {\tt Dict[KT, VT]} \\ {\tt Get older trades}. \end{tabular}
```

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#old-trade-lookup

Parameters

- **symbol** (str) required
- limit (int) Default 500; max 500.
- **fromId** (*str*) TradeId to fetch from. Default gets most recent trades.

Returns API response

```
[
    "id": 28457,

    "time": 1499827319559
}
```

Raises BinanceRequestException, BinanceAPIException

```
get_order(**params)
```

Check an order's status. Either orderId or origClientOrderId must be sent.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#query-order-user_data

Parameters

- **symbol** (str) required
- orderId (int) The unique order id
- origClientOrderId (str) optional
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

```
{
    "symbol": "LTCBTC",
    "orderId": 1,
    "clientOrderId": "myOrder1",
    "price": "0.1",
    "origQty": "1.0",

    "time": 1499827319559
}
```

Raises BinanceRequestException, BinanceAPIException

```
get_order_book (**params) → Dict[KT, VT]
```

Get the Order Book for the market

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#order-book

Parameters

- **symbol** (str) required
- limit (int) Default 100; max 1000

Returns API response

Raises BinanceRequestException, BinanceAPIException

get_orderbook_ticker(**params)

Latest price for a symbol or symbols.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#symbol-order-book-ticker

Parameters symbol (str) -

Returns API response

```
"symbol": "LTCBTC",
   "bidPrice": "4.00000000",
   "bidQty": "431.00000000",
   "askPrice": "4.00000200",
   "askQty": "9.00000000"
}
```

OR

Raises BinanceRequestException, BinanceAPIException

```
\mathtt{get\_orderbook\_tickers}() \rightarrow \mathrm{Dict}[\mathrm{KT},\mathrm{VT}]
```

Best price/qty on the order book for all symbols.

https://binance-docs.github.io/apidocs/spot/en/#symbol-order-book-ticker

Parameters symbol (str) - optional

Returns List of order book market entries

Raises BinanceRequestException, BinanceAPIException

```
\mathtt{get\_products}() \rightarrow \mathrm{Dict}[\mathrm{KT},\mathrm{VT}]
```

Return list of products currently listed on Binance

Use get_exchange_info() call instead

Returns list - List of product dictionaries

Raises BinanceRequestException, BinanceAPIException

```
get_recent_trades(**params) → Dict[KT, VT]
```

Get recent trades (up to last 500).

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#recent-trades-list

Parameters

- symbol(str) required
- limit (int) Default 500; max 500.

Returns API response

```
[
    "id": 28457,
    "price": "4.00000100",
    "qty": "12.00000000",
    "time": 1499865549590,
    "isBuyerMaker": true,
    "isBestMatch": true
}
]
```

Raises BinanceRequestException, BinanceAPIException

```
\texttt{get\_server\_time}() \rightarrow Dict[KT, VT]
```

Test connectivity to the Rest API and get the current server time.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#check-server-time

Returns Current server time

```
{
    "serverTime": 1499827319559
}
```

Raises BinanceRequestException, BinanceAPIException

Parameters symbol (str) - required e.g BNBBTC

Returns Dict if found. None if not

(continues on next page)

(continued from previous page)

```
"minQty": "0.00100000",
    "maxQty": "100000.00000000",

}, {
    "filterType": "MIN_NOTIONAL",
    "minNotional": "0.00100000"
}
```

Raises BinanceRequestException, BinanceAPIException

get_symbol_ticker(**params)

Latest price for a symbol or symbols.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md# 24hr-ticker-price-change-statistics

Parameters symbol (str) -

Returns API response

```
{
    "symbol": "LTCBTC",
    "price": "4.00000200"
}
```

OR

Raises BinanceRequestException, BinanceAPIException

get_system_status()

Get system status detail.

https://binance-docs.github.io/apidocs/spot/en/#system-status-sapi-system

Returns API response

```
{
   "status": 0,  # 0: normal1system maintenance
   "msg": "normal"  # normal or System maintenance.
}
```

Raises BinanceAPIException

```
get_ticker(**params)
```

24 hour price change statistics.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md# 24hr-ticker-price-change-statistics

Parameters symbol (str) -

Returns API response

```
"priceChange": "-94.99999800",

```

Raises BinanceRequestException, BinanceAPIException

```
get_trade_fee (**params)
Get trade fee.
```

https://binance-docs.github.io/apidocs/spot/en/#trade-fee-sapi-user_data

Parameters

- symbol (str) optional
- recvWindow (int) the number of milliseconds the request is valid for

Raises BinanceWithdrawException

```
get_universal_transfer_history(**params)
get_withdraw_history(**params)
    Fetch withdraw history.
```

https://binance-docs.github.io/apidocs/spot/en/#withdraw-history-supporting-network-user_data

Parameters

- coin (str) optional
- offset (int) optional default:0
- limit (int) optional
- **startTime** (*int*) optional Default: 90 days from current timestamp
- endTime (int) optional Default: present timestamp
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

User Universal Transfer

https://binance-docs.github.io/apidocs/spot/en/#user-universal-transfer

Parameters

- type (str (ENUM)) required
- asset (str) required
- amount (str) required
- recvWindow (int) the number of milliseconds the request is valid for

```
transfer_status = client.make_universal_transfer(params)
```

Returns API response

```
{
    "tranId":13526853623
}
```

Raises BinanceRequestException, BinanceAPIException

```

Any order with an icebergQty MUST have timeInForce set to GTC.

Parameters

- symbol (str) required
- **side** (str) required
- quantity (decimal) required
- price (str) required
- timeInForce (str) default Good till cancelled
- newClientOrderId (str) A unique id for the order. Automatically generated if not sent.
- icebergQty (decimal) Used with LIMIT, STOP_LOSS_LIMIT, and TAKE_PROFIT_LIMIT to create an iceberg order.
- newOrderRespType (str) Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

See order endpoint for full response options

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

```
order_limit_buy (timeInForce='GTC', **params)
```

Send in a new limit buy order

Any order with an icebergQty MUST have timeInForce set to GTC.

Parameters

- symbol(str) required
- quantity (decimal) required
- price (str) required
- timeInForce(str) default Good till cancelled
- newClientOrderId (str) A unique id for the order. Automatically generated if not sent.

- stopPrice (decimal) Used with stop orders
- icebergQty (decimal) Used with iceberg orders
- newOrderRespType (str) Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- recvWindow (int) the number of milliseconds the request is valid for

See order endpoint for full response options

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

```
order_limit_sell (timeInForce='GTC', **params)
```

Send in a new limit sell order

Parameters

- symbol (str) required
- quantity (decimal) required
- **price** (str) required
- timeInForce (str) default Good till cancelled
- newClientOrderId (str) A unique id for the order. Automatically generated if not sent.
- stopPrice (decimal) Used with stop orders
- icebergQty (decimal) Used with iceberg orders
- newOrderRespType (str) Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- recvWindow(int) the number of milliseconds the request is valid for

Returns API response

See order endpoint for full response options

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

order market (**params)

Send in a new market order

Parameters

- **symbol** (str) required
- **side** (*str*) required
- quantity (decimal) required
- quoteOrderQty (decimal) amount the user wants to spend (when buying) or receive (when selling) of the quote asset
- **newClientOrderId** (*str*) A unique id for the order. Automatically generated if not sent.

- **newOrderRespType** (*str*) Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- recvWindow (int) the number of milliseconds the request is valid for

See order endpoint for full response options

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

order_market_buy(**params)

Send in a new market buy order

Parameters

- symbol (str) required
- quantity (decimal) required
- quoteOrderQty (decimal) the amount the user wants to spend of the quote asset
- newClientOrderId (str) A unique id for the order. Automatically generated if not sent.
- newOrderRespType (str) Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

See order endpoint for full response options

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

order_market_sell(**params)

Send in a new market sell order

Parameters

- symbol (str) required
- quantity (decimal) required
- quoteOrderQty (decimal) the amount the user wants to receive of the quote asset
- newClientOrderId (str) A unique id for the order. Automatically generated if not sent.
- newOrderRespType (str) Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

See order endpoint for full response options

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

order_oco_buy(**params)

Send in a new OCO buy order

Parameters

- **symbol** (str) required
- **listClientOrderId** (str) A unique id for the list order. Automatically generated if not sent.
- quantity (decimal) required
- limitClientOrderId (str) A unique id for the limit order. Automatically generated if not sent.
- **price** (str) required
- limitIcebergQty (decimal) Used to make the LIMIT_MAKER leg an iceberg order.
- **stopClientOrderId** (*str*) A unique id for the stop order. Automatically generated if not sent.
- stopPrice (str) required
- stopLimitPrice(str) If provided, stopLimitTimeInForce is required.
- **stopIcebergQty** (decimal) Used with STOP_LOSS_LIMIT leg to make an iceberg order.
- **stopLimitTimeInForce** (*str*) Valid values are GTC/FOK/IOC.
- newOrderRespType (str) Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

See OCO order endpoint for full response options

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

order_oco_sell(**params)

Send in a new OCO sell order

Parameters

- symbol (str) required
- **listClientOrderId** (*str*) A unique id for the list order. Automatically generated if not sent.
- quantity (decimal) required
- limitClientOrderId (str) A unique id for the limit order. Automatically generated if not sent.
- price (str) required
- limitIcebergQty (decimal) Used to make the LIMIT_MAKER leg an iceberg order.
- **stopClientOrderId** (*str*) A unique id for the stop order. Automatically generated if not sent.

- stopPrice (str) required
- **stopLimitPrice** (*str*) If provided, stopLimitTimeInForce is required.
- **stopIcebergQty** (decimal) Used with STOP_LOSS_LIMIT leg to make an iceberg order.
- stopLimitTimeInForce (str) Valid values are GTC/FOK/IOC.
- newOrderRespType (str) Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- recvWindow (int) the number of milliseconds the request is valid for

See OCO order endpoint for full response options

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

```
ping() \rightarrow Dict[KT, VT]
```

Test connectivity to the Rest API.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#test-connectivity

Returns Empty array

{ }

Raises BinanceRequestException, BinanceAPIException

https://binance-docs.github.io/apidocs/spot/en/#query-user-universal-transfer-history

Parameters

- type (str (ENUM)) required
- startTime (int) optional
- endTime (int) optional
- current (int) optional Default 1
- size (int) required Default 10, Max 100
- recvWindow (int) the number of milliseconds the request is valid for

```
transfer_status = client.query_universal_transfer_history(params)
```

Returns API response

```
"total":2,
    "rows":[
            "asset":"USDT",
            "amount":"1",
            "type": "MAIN_UMFUTURE"
            "status": "CONFIRMED",
            "tranId": 11415955596,
             "timestamp":1544433328000
        },
            "asset": "USDT",
             "amount": "2",
             "type": "MAIN_UMFUTURE",
             "status": "CONFIRMED",
             "tranId": 11366865406,
            "timestamp":1544433328000
    ]
}
```

Raises BinanceRequestException, BinanceAPIException

```
redeem_lending_product (**params)
repay_margin_loan (**params)
stream_close (listenKey)
```

Close out a user data stream.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#close-user-data-stream-user_stream

```
Parameters listenKey (str) - required
```

Returns API response

```
{}
```

Raises BinanceRequestException, BinanceAPIException

```
stream_get_listen_key()
```

Start a new user data stream and return the listen key If a stream already exists it should return the same key. If the stream becomes invalid a new key is returned.

Can be used to keep the user stream alive.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#start-user-data-stream-user_stream

Returns API response

Raises BinanceRequestException, BinanceAPIException

```
stream_keepalive (listenKey)
```

PING a user data stream to prevent a time out.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md# keepalive-user-data-stream-user_stream

Parameters listenKey (str) – required

Returns API response

```
{}
```

Raises BinanceRequestException, BinanceAPIException

```
toggle_bnb_burn_spot_margin(**params)
transfer_dust(**params)
```

Convert dust assets to BNB.

https://binance-docs.github.io/apidocs/spot/en/#dust-transfer-user_data

Parameters

- asset (str) The asset being converted. e.g. 'ONE'
- recvWindow (int) the number of milliseconds the request is valid for

```
result = client.transfer_dust(asset='ONE')
```

Returns API response

Raises BinanceRequestException, BinanceAPIException

```
transfer_history(**params)
transfer_isolated_margin_to_spot(**params)
transfer_margin_to_spot(**params)
transfer_spot_to_isolated_margin(**params)
transfer_spot_to_margin(**params)
```

```
universal_transfer(**params)
withdraw(**params)
```

Submit a withdraw request.

https://binance-docs.github.io/apidocs/spot/en/#withdraw-sapi

Assumptions

- You must have Withdraw permissions enabled on your API key
- You must have withdrawn to the address specified through the website and approved the transaction via email

Parameters

- coin (str) required
- withdrawOrderId (str) optional client id for withdraw
- network (str) optional
- address (str) optional
- amount (decimal) required
- **transactionFeeFlag** (bool) required When making internal transfer, true for returning the fee to the destination account; false for returning the fee back to the departure account. Default false.
- name (str) optional Description of the address, default asset value passed will be used
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

```
{
    "id":"7213fea8e94b4a5593d507237e5a555b"
}
```

Raises BinanceRequestException, BinanceAPIException, BinanceWithdrawException

Parameters

- api_key (str.) Api Key
- api_secret (str.) Api Secret
- requests_params (dict.) optional Dictionary of requests params to use for all calls
- **testnet** (bool) Use testnet environment only available for vanilla options at the moment

```
class binance.client.Client (api\_key: Optional[str] = None, api\_secret: Optional[str] = None, requests\_params: Dict[str, str] = None, tld: str = 'com', testnet: bool = False)

Bases: binance.client.BaseClient
```

__init__ (api_key: Optional[str] = None, api_secret: Optional[str] = None, requests_params:

Dict[str, str] = None, tld: str = 'com', testnet: bool = False)

Binance API Client constructor

Parameters

- api_key (str.) Api Key
- api_secret (str.) Api Secret
- requests_params (dict.) optional Dictionary of requests params to use for all calls
- **testnet** (bool) Use testnet environment only available for vanilla options at the moment

```
aggregate_trade_iter (symbol: str, start_str=None, last_id=None)
```

Iterate over aggregate trade data from (start_time or last_id) to the end of the history so far.

If start_time is specified, start with the first trade after start_time. Meant to initialise a local cache of trade data.

If last_id is specified, start with the trade after it. This is meant for updating a pre-existing local trade data cache.

Only allows start_str or last_id—not both. Not guaranteed to work right if you're running more than one of these simultaneously. You will probably hit your rate limit.

See dateparser docs for valid start and end string formats http://dateparser.readthedocs.io/en/latest/

If using offset strings for dates add "UTC" to date string e.g. "now UTC", "11 hours ago UTC"

Parameters

- symbol (str) Symbol string e.g. ETHBTC
- start_str Start date string in UTC format or timestamp in milliseconds. The iterator will

return the first trade occurring later than this time. :type start_str: strlint :param last_id: aggregate trade ID of the last known aggregate trade. Not a regular trade ID. See https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#compressedaggregate-trades-list.

Returns an iterator of JSON objects, one per trade. The format of

each object is identical to Client.aggregate_trades().

```
cancel_margin_order(**params)
```

Cancel an active order for margin account.

Either orderId or origClientOrderId must be sent.

https://binance-docs.github.io/apidocs/spot/en/#margin-account-cancel-order-trade

Parameters

- **symbol** (str) required
- isIsolated (str) set to 'TRUE' for isolated margin (default 'FALSE')
- orderId(str)-
- origClientOrderId(str)-
- **newClientOrderId** (*str*) Used to uniquely identify this cancel. Automatically generated by default.
- recvWindow (int) the number of milliseconds the request is valid for

Returns

```
API response
```

```
{ "symbol": "LTCBTC", "orderId": 28, "origClientOrderId": "myOrder1", "clientOrderId": "cancelMyOrder1", "transactTime": 1507725176595, "price": "1.000000000", "origQty": "10.00000000", "executedQty": "8.00000000", "cummulativeQuoteQty": "8.00000000", "status": "CANCELED", "timeInForce": "GTC", "type": "LIMIT", "side": "SELL"
```

Raises BinanceRequestException, BinanceAPIException

```
cancel_order(**params)
```

Cancel an active order. Either orderId or origClientOrderId must be sent.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#cancel-order-trade

Parameters

- **symbol** (str) required
- orderId (int) The unique order id
- origClientOrderId (str) optional

- **newClientOrderId** (*str*) Used to uniquely identify this cancel. Automatically generated by default.
- recvWindow (int) the number of milliseconds the request is valid for

```
{
    "symbol": "LTCBTC",
    "origClientOrderId": "myOrder1",
    "orderId": 1,
    "clientOrderId": "cancelMyOrder1"
}
```

Raises BinanceRequestException, BinanceAPIException

change_fixed_activity_to_daily_position(**params)

Change Fixed/Activity Position to Daily Position

https://binance-docs.github.io/apidocs/spot/en/#change-fixed-activity-position-to-daily-position-user_data

create_isolated_margin_account(**params)

Create isolated margin account for symbol

https://binance-docs.github.io/apidocs/spot/en/#create-isolated-margin-account-margin

Parameters

- base (str) Base asset of symbol
- quote (str) Quote asset of symbol

```
pair_details = client.create_isolated_margin_account(base='USDT', quote='BTC')
```

Returns API response

```
{
    "success": true,
    "symbol": "BTCUSDT"
}
```

Raises BinanceRequestException, BinanceAPIException

create_margin_loan(**params)

Apply for a loan in cross-margin or isolated-margin account.

https://binance-docs.github.io/apidocs/spot/en/#margin-account-borrow-margin

Parameters

- asset (str) name of the asset
- amount (str) amount to transfer
- **isIsolated** (*str*) set to 'TRUE' for isolated margin (default 'FALSE')
- **symbol** (str) Isolated margin symbol (default blank for cross-margin)
- recvWindow(int) the number of milliseconds the request is valid for

```
{
    "tranId": 100000001
}
```

Raises BinanceRequestException, BinanceAPIException

create_margin_order(**params)

Post a new order for margin account.

https://binance-docs.github.io/apidocs/spot/en/#margin-account-new-order-trade

Parameters

- **symbol** (str) required
- **isIsolated** (*str*) set to 'TRUE' for isolated margin (default 'FALSE')
- **side** (str) required
- type (str) required
- quantity (decimal) required
- **price** (str) required
- **stopPrice** (*str*) Used with STOP_LOSS, STOP_LOSS_LIMIT, TAKE_PROFIT, and TAKE_PROFIT_LIMIT orders.
- timeInForce (str) required if limit order GTC,IOC,FOK
- newClientOrderId (str) A unique id for the order. Automatically generated if not sent.
- icebergQty (str) Used with LIMIT, STOP_LOSS_LIMIT, and TAKE_PROFIT_LIMIT to create an iceberg order.
- **newOrderRespType** (*str*) Set the response JSON. ACK, RESULT, or FULL; MAR-KET and LIMIT order types default to FULL, all other orders default to ACK.
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

Response ACK:

```
"symbol": "BTCUSDT",
  "orderId": 28,
  "clientOrderId": "6gCrw2kRUAF9CvJDGP16IP",
  "transactTime": 1507725176595
}
```

Response RESULT:

```

(continues on next page)

(continued from previous page)

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

```
create_oco_order(**params)
```

Send in a new OCO order

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#new-oco-trade

Parameters

- **symbol** (str) required
- **listClientOrderId** (str) A unique id for the list order. Automatically generated if not sent.
- **side** (str) required
- quantity (decimal) required
- limitClientOrderId (str) A unique id for the limit order. Automatically generated if not sent.
- price (str) required
- limitIcebergQty (decimal) Used to make the LIMIT_MAKER leg an iceberg order.
- **stopClientOrderId** (*str*) A unique id for the stop order. Automatically generated if not sent.
- stopPrice (str) required
- **stopLimitPrice** (*str*) If provided, stopLimitTimeInForce is required.
- **stopIcebergQty** (decimal) Used with STOP_LOSS_LIMIT leg to make an iceberg order.
- stopLimitTimeInForce (str) Valid values are GTC/FOK/IOC.
- newOrderRespType (str) Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

Response ACK:

```
{
}
```

Response RESULT:

```
Response FULL:
```

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

```
create_order(**params)
```

Send in a new order

Any order with an icebergQty MUST have timeInForce set to GTC.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#new-order-trade

Parameters

- **symbol** (str) required
- **side** (str) required
- type (str) required
- timeInForce (str) required if limit order
- quantity (decimal) required
- **quoteOrderQty** (*decimal*) amount the user wants to spend (when buying) or receive (when selling) of the quote asset, applicable to MARKET orders
- **price** (str) required
- newClientOrderId (str) A unique id for the order. Automatically generated if not sent.
- icebergQty (decimal) Used with LIMIT, STOP_LOSS_LIMIT, and TAKE_PROFIT_LIMIT to create an iceberg order.
- newOrderRespType (str) Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

Response ACK:

```
{
    "symbol":"LTCBTC",
    "orderId": 1,
    "clientOrderId": "myOrder1" # Will be newClientOrderId
    "transactTime": 1499827319559
}
```

Response RESULT:

```
"symbol": "BTCUSDT",
  "orderId": 28,
  "clientOrderId": "6gCrw2kRUAF9CvJDGP16IP",
  "transactTime": 1507725176595,
  "price": "0.000000000",
  "origQty": "10.000000000",
  "executedQty": "10.000000000",
  "status": "FILLED",
  "timeInForce": "GTC",
  "type": "MARKET",
  "side": "SELL"
}
```

Response FULL:

```
"symbol": "BTCUSDT",
"orderId": 28,
"clientOrderId": "6gCrw2kRUAF9CvJDGP16IP",
"transactTime": 1507725176595,
"price": "0.00000000",

        "commissionAsset": "USDT"
    },
        "price": "3995.00000000",
        "qty": "1.00000000",
        "commission": "3.99500000",
```

(continues on next page)

(continued from previous page)

```
"commissionAsset": "USDT"
}
]
```

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

create_sub_account_futures_transfer(**params)

Execute sub-account Futures transfer

https://github.com/binance-exchange/binance-official-api-docs/blob/9dbe0e961b80557bb19708a707c7fad08842b28e/wapi-api.md#sub-account-transferfor-master-account

Parameters

- **fromEmail** (str) required Sender email
- toEmail (str) required Recipient email
- futuresType (int) required
- asset (str) required
- amount (decimal) required
- recvWindow (int) optional

Returns API response

```
{
    "success":true,
    "txnId":"2934662589"
}
```

Raises BinanceRequestException, BinanceAPIException

create_test_order(**params)

Test new order creation and signature/recvWindow long. Creates and validates a new order but does not send it into the matching engine.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#test-new-order-trade

Parameters

- **symbol** (str) required
- side (str) required
- type (str) required
- timeInForce (str) required if limit order
- quantity (decimal) required
- price (str) required
- **newClientOrderId** (str) A unique id for the order. Automatically generated if not sent.
- icebergQty (decimal) Used with iceberg orders

- newOrderRespType (str) Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- recvWindow (int) The number of milliseconds the request is valid for

```
{ }
```

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

disable_fast_withdraw_switch(**params)

Disable Fast Withdraw Switch

https://binance-docs.github.io/apidocs/spot/en/#disable-fast-withdraw-switch-user_data

Parameters recvWindow (int) - optional

Returns API response

Raises BinanceRequestException, BinanceAPIException

enable fast withdraw switch(**params)

Enable Fast Withdraw Switch

https://binance-docs.github.io/apidocs/spot/en/#enable-fast-withdraw-switch-user_data

Parameters recvWindow (int) - optional

Returns API response

Raises BinanceRequestException, BinanceAPIException

enable_subaccount_futures(**params)

Enable Futures for Sub-account (For Master Account)

https://binance-docs.github.io/apidocs/spot/en/#enable-futures-for-sub-account-for-master-account

Parameters

- email (str) required Sub account email
- recvWindow (int) optional

Returns API response

```
"email":"123@test.com",
"isFuturesEnabled": true // true or false
```

Raises BinanceRequestException, BinanceAPIException

enable_subaccount_margin(**params)

Enable Margin for Sub-account (For Master Account)

https://binance-docs.github.io/apidocs/spot/en/#enable-margin-for-sub-account-for-master-account

Parameters

- email (str) required Sub account email
- recvWindow (int) optional

Returns API response

```
"email":"123@test.com",
"isMarginEnabled": true
```

Raises BinanceRequestException, BinanceAPIException

futures_account (**params)

Get current account information.

https://binance-docs.github.io/apidocs/futures/en/#account-information-user_data

futures_account_balance(**params)

Get futures account balance

https://binance-docs.github.io/apidocs/futures/en/#future-account-balance-user_data

futures_account_trades (**params)

Get trades for the authenticated account and symbol.

https://binance-docs.github.io/apidocs/futures/en/#account-trade-list-user_data

futures_account_transfer(**params)

Execute transfer between spot account and futures account.

https://binance-docs.github.io/apidocs/futures/en/#new-future-account-transfer

futures_aggregate_trades (**params)

Get compressed, aggregate trades. Trades that fill at the time, from the same order, with the same price will have the quantity aggregated.

https://binance-docs.github.io/apidocs/futures/en/#compressed-aggregate-trades-list-market_data

futures_cancel_all_open_orders(**params)

Cancel all open futures orders

https://binance-docs.github.io/apidocs/futures/en/#cancel-all-open-orders-trade

futures_cancel_order(**params)

Cancel an active futures order.

https://binance-docs.github.io/apidocs/futures/en/#cancel-order-trade

futures_cancel_orders(**params)

Cancel multiple futures orders

https://binance-docs.github.io/apidocs/futures/en/#cancel-multiple-orders-trade

futures_change_leverage (**params)

Change user's initial leverage of specific symbol market

https://binance-docs.github.io/apidocs/futures/en/#change-initial-leverage-trade

futures_change_margin_type(**params)

Change the margin type for a symbol

https://binance-docs.github.io/apidocs/futures/en/#change-margin-type-trade

futures_change_multi_assets_mode (multiAssetsMargin: bool)

Change user's Multi-Assets mode (Multi-Assets Mode or Single-Asset Mode) on Every symbol

https://binance-docs.github.io/apidocs/futures/en/#change-multi-assets-mode-trade

futures_change_position_margin(**params)

Change the position margin for a symbol

https://binance-docs.github.io/apidocs/futures/en/#modify-isolated-position-margin-trade

futures_change_position_mode(**params)

Change position mode for authenticated account

https://binance-docs.github.io/apidocs/futures/en/#change-position-mode-trade

futures_coin_account(**params)

Get current account information.

https://binance-docs.github.io/apidocs/delivery/en/#account-information-user_data

futures_coin_account_balance(**params)

Get futures account balance

https://binance-docs.github.io/apidocs/delivery/en/#futures-account-balance-user_data

futures_coin_account_trades (**params)

Get trades for the authenticated account and symbol.

https://binance-docs.github.io/apidocs/delivery/en/#account-trade-list-user_data

futures_coin_aggregate_trades (**params)

Get compressed, aggregate trades. Trades that fill at the time, from the same order, with the same price will have the quantity aggregated.

https://binance-docs.github.io/apidocs/delivery/en/#compressed-aggregate-trades-list

futures_coin_cancel_all_open_orders(**params)

Cancel all open futures orders

https://binance-docs.github.io/apidocs/delivery/en/#cancel-all-open-orders-trade

futures_coin_cancel_order(**params)

Cancel an active futures order.

https://binance-docs.github.io/apidocs/delivery/en/#cancel-order-trade

futures_coin_cancel_orders(**params)

Cancel multiple futures orders

https://binance-docs.github.io/apidocs/delivery/en/#cancel-multiple-orders-trade

futures_coin_change_leverage(**params)

Change user's initial leverage of specific symbol market

https://binance-docs.github.io/apidocs/delivery/en/#change-initial-leverage-trade

futures_coin_change_margin_type (**params)

Change the margin type for a symbol

https://binance-docs.github.io/apidocs/delivery/en/#change-margin-type-trade

futures_coin_change_position_margin(**params)

Change the position margin for a symbol

https://binance-docs.github.io/apidocs/delivery/en/#modify-isolated-position-margin-trade

futures_coin_change_position_mode(**params)

Change user's position mode (Hedge Mode or One-way Mode) on EVERY symbol

https://binance-docs.github.io/apidocs/delivery/en/#change-position-mode-trade

futures_coin_continous_klines(**params)

Kline/candlestick bars for a specific contract type. Klines are uniquely identified by their open time.

https://binance-docs.github.io/apidocs/delivery/en/#continuous-contract-kline-candlestick-data

futures_coin_create_order(**params)

Send in a new order.

https://binance-docs.github.io/apidocs/delivery/en/#new-order-trade

futures_coin_exchange_info()

Current exchange trading rules and symbol information

https://binance-docs.github.io/apidocs/delivery/en/#exchange-information

futures_coin_funding_rate(**params)

Get funding rate history

https://binance-docs.github.io/apidocs/delivery/en/#get-funding-rate-history-of-perpetual-futures

futures_coin_get_all_orders(**params)

Get all futures account orders; active, canceled, or filled.

https://binance-docs.github.io/apidocs/delivery/en/#all-orders-user_data

futures_coin_get_open_orders(**params)

Get all open orders on a symbol.

https://binance-docs.github.io/apidocs/delivery/en/#current-all-open-orders-user_data

futures_coin_get_order(**params)

Check an order's status.

https://binance-docs.github.io/apidocs/delivery/en/#query-order-user_data

futures_coin_get_position_mode(**params)

Get user's position mode (Hedge Mode or One-way Mode) on EVERY symbol

https://binance-docs.github.io/apidocs/delivery/en/#get-current-position-mode-user_data

futures coin historical trades(**params)

Get older market historical trades.

https://binance-docs.github.io/apidocs/delivery/en/#old-trades-lookup-market_data

futures_coin_income_history(**params)

Get income history for authenticated account

https://binance-docs.github.io/apidocs/delivery/en/#get-income-history-user_data

futures_coin_index_price_klines(**params)

Kline/candlestick bars for the index price of a pair..

https://binance-docs.github.io/apidocs/delivery/en/#index-price-kline-candlestick-data

futures_coin_klines(**params)

Kline/candlestick bars for a symbol. Klines are uniquely identified by their open time.

https://binance-docs.github.io/apidocs/delivery/en/#kline-candlestick-data

futures_coin_leverage_bracket(**params)

Notional and Leverage Brackets

https://binance-docs.github.io/apidocs/delivery/en/#notional-bracket-for-pair-user_data

futures_coin_liquidation_orders(**params)

Get all liquidation orders

https://binance-docs.github.io/apidocs/delivery/en/#get-all-liquidation-orders

futures_coin_mark_price(**params)

Get Mark Price and Funding Rate

https://binance-docs.github.io/apidocs/delivery/en/#index-price-and-mark-price

futures_coin_mark_price_klines(**params)

Kline/candlestick bars for the index price of a pair..

https://binance-docs.github.io/apidocs/delivery/en/#mark-price-kline-candlestick-data

futures_coin_open_interest(**params)

Get present open interest of a specific symbol.

https://binance-docs.github.io/apidocs/delivery/en/#open-interest

futures_coin_open_interest_hist(**params)

Get open interest statistics of a specific symbol.

https://binance-docs.github.io/apidocs/delivery/en/#open-interest-statistics-market-data

futures_coin_order_book (**params)

Get the Order Book for the market

https://binance-docs.github.io/apidocs/delivery/en/#order-book

futures_coin_orderbook_ticker(**params)

Best price/qty on the order book for a symbol or symbols.

https://binance-docs.github.io/apidocs/delivery/en/#symbol-order-book-ticker

futures coin ping()

Test connectivity to the Rest API

https://binance-docs.github.io/apidocs/delivery/en/#test-connectivity

futures coin position information(**params)

Get position information

https://binance-docs.github.io/apidocs/delivery/en/#position-information-user_data

futures_coin_position_margin_history(**params)

Get position margin change history

https://binance-docs.github.io/apidocs/delivery/en/#get-position-margin-change-history-trade

futures_coin_recent_trades (**params)

Get recent trades (up to last 500).

https://binance-docs.github.io/apidocs/delivery/en/#recent-trades-list

futures_coin_stream_close(listenKey)

futures_coin_stream_get_listen_key()

futures_coin_stream_keepalive(listenKey)

futures_coin_symbol_ticker(**params)

Latest price for a symbol or symbols.

https://binance-docs.github.io/apidocs/delivery/en/#symbol-price-ticker

futures_coin_ticker(**params)

24 hour rolling window price change statistics.

https://binance-docs.github.io/apidocs/delivery/en/#24hr-ticker-price-change-statistics

futures_coin_time()

Test connectivity to the Rest API and get the current server time.

https://binance-docs.github.io/apidocs/delivery/en/#check-server-time

futures_continous_klines(**params)

Kline/candlestick bars for a specific contract type. Klines are uniquely identified by their open time.

https://binance-docs.github.io/apidocs/futures/en/#continuous-contract-kline-candlestick-data

futures_create_order(**params)

Send in a new order.

https://binance-docs.github.io/apidocs/futures/en/#new-order-trade

futures_exchange_info()

Current exchange trading rules and symbol information

https://binance-docs.github.io/apidocs/futures/en/#exchange-information-market_data

futures_funding_rate(**params)

Get funding rate history

https://binance-docs.github.io/apidocs/futures/en/#get-funding-rate-history-market_data

futures_get_all_orders(**params)

Get all futures account orders; active, canceled, or filled.

https://binance-docs.github.io/apidocs/futures/en/#all-orders-user_data

futures_get_multi_assets_mode()

Get user's Multi-Assets mode (Multi-Assets Mode or Single-Asset Mode) on Every symbol

https://binance-docs.github.io/apidocs/futures/en/#get-current-multi-assets-mode-user_data

futures_get_open_orders (**params)

Get all open orders on a symbol.

https://binance-docs.github.io/apidocs/futures/en/#current-open-orders-user_data

futures_get_order(**params)

Check an order's status.

https://binance-docs.github.io/apidocs/futures/en/#query-order-user_data

futures_get_position_mode(**params)

Get position mode for authenticated account

https://binance-docs.github.io/apidocs/futures/en/#get-current-position-mode-user_data

futures_historical_klines (symbol, interval, start_str, end_str=None, limit=500)

Get historical futures klines from Binance

Parameters

- **symbol** (str) Name of symbol pair e.g BNBBTC
- interval (str) Binance Kline interval
- start_str(str/int) Start date string in UTC format or timestamp in milliseconds
- end_str (str/int) optional end date string in UTC format or timestamp in milliseconds (default will fetch everything up to now)
- limit (int) Default 500; max 1000.

Returns list of OHLCV values

futures_historical_klines_generator(symbol, interval, start_str, end_str=None)

Get historical futures klines generator from Binance

Parameters

- **symbol** (str) Name of symbol pair e.g BNBBTC
- interval (str) Binance Kline interval
- start_str (str/int) Start date string in UTC format or timestamp in milliseconds
- **end_str** (*str/int*) optional end date string in UTC format or timestamp in milliseconds (default will fetch everything up to now)

Returns generator of OHLCV values

futures_historical_trades(**params)

Get older market historical trades.

https://binance-docs.github.io/apidocs/futures/en/#old-trades-lookup-market_data

futures_income_history(**params)

Get income history for authenticated account

https://binance-docs.github.io/apidocs/futures/en/#get-income-history-user_data

futures_klines(**params)

Kline/candlestick bars for a symbol. Klines are uniquely identified by their open time.

https://binance-docs.github.io/apidocs/futures/en/#kline-candlestick-data-market_data

futures leverage bracket(**params)

Notional and Leverage Brackets

https://binance-docs.github.io/apidocs/futures/en/#notional-and-leverage-brackets-market_data

futures liquidation orders(**params)

Get all liquidation orders

https://binance-docs.github.io/apidocs/futures/en/#get-all-liquidation-orders-market_data

futures_mark_price(**params)

Get Mark Price and Funding Rate

https://binance-docs.github.io/apidocs/futures/en/#mark-price-market_data

futures_open_interest(**params)

Get present open interest of a specific symbol.

https://binance-docs.github.io/apidocs/futures/en/#open-interest-market_data

futures_open_interest_hist(**params)

Get open interest statistics of a specific symbol.

https://binance-docs.github.io/apidocs/futures/en/#open-interest-statistics

futures_order_book (**params)

Get the Order Book for the market

https://binance-docs.github.io/apidocs/futures/en/#order-book-market data

futures_orderbook_ticker(**params)

Best price/qty on the order book for a symbol or symbols.

https://binance-docs.github.io/apidocs/futures/en/#symbol-order-book-ticker-market_data

futures_ping()

Test connectivity to the Rest API

https://binance-docs.github.io/apidocs/futures/en/#test-connectivity

futures_place_batch_order(**params)

Send in new orders.

https://binance-docs.github.io/apidocs/futures/en/#place-multiple-orders-trade

To avoid modifying the existing signature generation and parameter order logic, the url encoding is done on the special query param, batchOrders, in the early stage.

futures_position_information(**params)

Get position information

https://binance-docs.github.io/apidocs/futures/en/#position-information-user_data

futures_position_margin_history(**params)

Get position margin change history

https://binance-docs.github.io/apidocs/futures/en/#get-postion-margin-change-history-trade

futures_recent_trades (**params)

Get recent trades (up to last 500).

https://binance-docs.github.io/apidocs/futures/en/#recent-trades-list-market_data

```
futures stream close(listenKey)
```

```
futures_stream_get_listen_key()
```

futures_stream_keepalive(listenKey)

futures_symbol_ticker(**params)

Latest price for a symbol or symbols.

https://binance-docs.github.io/apidocs/futures/en/#symbol-price-ticker-market_data

futures_ticker(**params)

24 hour rolling window price change statistics.

https://binance-docs.github.io/apidocs/futures/en/#24hr-ticker-price-change-statistics-market_data

futures_time()

Test connectivity to the Rest API and get the current server time.

https://binance-docs.github.io/apidocs/futures/en/#check-server-time

get_account (**params)

Get current account information.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#account-information-user_data

Parameters recvWindow (int) – the number of milliseconds the request is valid for **Returns** API response

```
"makerCommission": 15,
"takerCommission": 15,
"buverCommission": 0,
"sellerCommission": 0,
"canTrade": true,
"canWithdraw": true,
"canDeposit": true,
"balances": [
    {
        "asset": "BTC",
        "free": "4723846.89208129",
        "locked": "0.00000000"
    },
        "asset": "LTC",
        "free": "4763368.68006011",
        "locked": "0.00000000"
]
```

Raises BinanceRequestException, BinanceAPIException

get_account_api_trading_status(**params)

Fetch account api trading status detail.

https://binance-docs.github.io/apidocs/spot/en/#account-api-trading-status-sapi-user_data

Parameters recvWindow(int) – the number of milliseconds the request is valid for

Returns API response

```
"data": {
                       // API trading status detail
       "isLocked": false, // API trading function is locked or not
       "plannedRecoverTime": 0, // If API trading function is locked, this,
\hookrightarrow is the planned recover time
       "triggerCondition": {
               "GCR": 150, // Number of GTC orders
                "IFER": 150, // Number of FOK/IOC orders
                "UFR": 300 // Number of orders
       "indicators": { // The indicators updated every 30 seconds
             "BTCUSDT": [ // The symbol
                    "i": "UFR", // Unfilled Ratio (UFR)
                    "c": 20,
                                 // Count of all orders
                    "v": 0.05,
                                 // Current UFR value
                    "t": 0.995
                                // Trigger UFR value
                },
                {
```

(continues on next page)

```
"i": "IFER", // IOC/FOK Expiration Ratio (IFER)
                "c": 20,
                             // Count of FOK/IOC orders
                "v": 0.99,
                             // Current IFER value
                "t": 0.99
                             // Trigger IFER value
            },
                "i": "GCR",
                             // GTC Cancellation Ratio (GCR)
                "c": 20,
                             // Count of GTC orders
                "v": 0.99,

Raises BinanceWithdrawException

get account snapshot(**params)

Get daily account snapshot of specific type.

https://binance-docs.github.io/apidocs/spot/en/#daily-account-snapshot-user_data

Parameters

- type (string) required. Valid values are SPOT/MARGIN/FUTURES.
- startTime (int) optional
- endTime (int) optional
- limit (int) optional
- recvWindow (int) optional

Returns API response

```
"code":200, // 200 for success; others are error codes
"msg":"", // error message
"snapshotVos":[
  {
      "data":{
         "balances":[

```

get_account_status(**params)

Get account status detail.

https://binance-docs.github.io/apidocs/spot/en/#account-status-sapi-user_data

Parameters recvWindow (int) – the number of milliseconds the request is valid for

Returns API response

```
{
    "data": "Normal"
}
```

Raises BinanceWithdrawException

get_aggregate_trades (**params) → Dict[KT, VT]

Get compressed, aggregate trades. Trades that fill at the time, from the same order, with the same price will have the quantity aggregated.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md# compressedaggregate-trades-list

Parameters

- **symbol** (str) required
- **fromId** (str) ID to get aggregate trades from INCLUSIVE.

- **startTime** (*int*) Timestamp in ms to get aggregate trades from INCLUSIVE.
- endTime (int) Timestamp in ms to get aggregate trades until INCLUSIVE.
- limit (int) Default 500; max 500.

Returns API response

Raises BinanceRequestException, BinanceAPIException

get_all_coins_info(**params)

Get information of coins (available for deposit and withdraw) for user.

https://binance-docs.github.io/apidocs/spot/en/#all-coins-39-information-user_data

Parameters recvWindow (int) - optional

Returns API response

```
"coin": "BTC",
   "depositAllEnable": true,

   ]
```

Raises BinanceRequestException, BinanceAPIException

get_all_isolated_margin_symbols(**params)

Query isolated margin symbol info for all pairs

https://binance-docs.github.io/apidocs/spot/en/#get-all-isolated-margin-symbol-user_data

```
pair_details = client.get_all_isolated_margin_symbols()
```

Returns API response

```
[
    "base": "BNB",
    "isBuyAllowed": true,
    "isMarginTrade": true,
    "isSellAllowed": true,
    "quote": "BTC",
    "symbol": "BNBBTC"
},
{
    "base": "TRX",
```

(continues on next page)

```
"isBuyAllowed": true,
    "isMarginTrade": true,
    "isSellAllowed": true,
    "quote": "BTC",
    "symbol": "TRXBTC"
}
```

Raises BinanceRequestException, BinanceAPIException

```
get_all_margin_orders(**params)
```

Query all margin accounts orders

If orderId is set, it will get orders >= that orderId. Otherwise most recent orders are returned.

For some historical orders cummulativeQuoteQty will be < 0, meaning the data is not available at this time.

https://binance-docs.github.io/apidocs/spot/en/#query-margin-account-39-s-all-order-user_data

Parameters

- symbol (str) required
- isIsolated (str) set to 'TRUE' for isolated margin (default 'FALSE')
- orderId (str) optional
- startTime (str) optional
- endTime (str) optional
- limit (int) Default 500; max 1000
- recvWindow (int) the number of milliseconds the request is valid for

Returns

```
API response

[

{ "id": 43123876, "price": "0.00395740", "qty": "4.06000000", "quoteQty": "0.01606704", "symbol": "BNBBTC", "time": 1556089977693

}, {

    "id": 43123877, "price": "0.00395740", "qty": "0.77000000", "quoteQty": "0.00304719", "symbol": "BNBBTC", "time": 1556089977693

}, {

    "id": 43253549, "price": "0.00428930", "qty": "23.30000000", "quoteQty": "0.09994069", "symbol": "BNBBTC", "time": 1556163963504

}
```

Raises BinanceRequestException, BinanceAPIException

```
get_all_orders(**params)
```

Get all account orders; active, canceled, or filled.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#all-orders-user_data

Parameters

- **symbol** (str) required
- orderId (int) The unique order id
- limit (int) Default 500; max 500.
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

Raises BinanceRequestException, BinanceAPIException

```
get_all_tickers (symbol: Optional[str] = None) \rightarrow Dict[KT, VT] Latest price for a symbol or symbols.
```

https://binance-docs.github.io/apidocs/spot/en/#symbol-price-ticker

Parameters symbol (str) – optional

Returns List of market tickers

Raises BinanceRequestException, BinanceAPIException

```
get_asset_balance (asset, **params)
Get current asset balance.
```

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#account-information-user_data

Parameters

- asset (str) required
- recvWindow (int) the number of milliseconds the request is valid for

Returns dictionary or None if not found

```
{
    "asset": "BTC",
    "free": "4723846.89208129",
    "locked": "0.000000000"
}
```

Raises BinanceRequestException, BinanceAPIException

get_asset_details(**params)

Fetch details on assets.

https://binance-docs.github.io/apidocs/spot/en/#asset-detail-sapi-user_data

Parameters

- asset (str) optional
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

```
"CTR": {
    "minWithdrawAmount": "70.00000000", //min withdraw amount
    "depositStatus": false,//deposit status (false if ALL of networks

' are false)
    "withdrawFee": 35, // withdraw fee
    "withdrawStatus": true, //withdraw status (false if ALL of
    onetworks' are false)
    "depositTip": "Delisted, Deposit Suspended" //reason
},
    "SKY": {
        "minWithdrawAmount": "0.02000000",
        "depositStatus": true,
        "withdrawFee": 0.01,
        "withdrawStatus": true
}
```

Raises BinanceWithdrawException

get_asset_dividend_history(**params)

Query asset dividend record.

https://binance-docs.github.io/apidocs/spot/en/#asset-dividend-record-user_data

Parameters

- asset (str) optional
- startTime (long) optional
- endTime (long) optional
- recvWindow (int) the number of milliseconds the request is valid for

```
result = client.get_asset_dividend_history()
```

Returns API response

Raises BinanceRequestException, BinanceAPIException

get_avg_price(**params)

Current average price for a symbol.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#current-average-price

Parameters symbol (str) -

Returns API response

```
{
    "mins": 5,
    "price": "9.35751834"
}
```

get_bnb_burn_spot_margin(**params)

Get BNB Burn Status

https://binance-docs.github.io/apidocs/spot/en/#get-bnb-burn-status-user_data

```
status = client.get_bnb_burn_spot_margin()
```

Returns API response

```
{
    "spotBNBBurn":true,
    "interestBNBBurn": false
}
```

Raises BinanceRequestException, BinanceAPIException

```
get_deposit_address (coin: str, network: Optional[str] = None, **params)
Fetch a deposit address for a symbol
```

https://binance-docs.github.io/apidocs/spot/en/#deposit-address-supporting-network-user_data

Parameters

- coin (str) required
- network (str) optional
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

```
{
    "address": "1HPn8Rx2y6nNSfagQBKy27GB99Vbzg89wv",
    "coin": "BTC",
    "tag": "",
    "url": "https://btc.com/1HPn8Rx2y6nNSfagQBKy27GB99Vbzg89wv"
}
```

Raises BinanceRequestException, BinanceAPIException

```
get_deposit_history(**params)
```

Fetch deposit history.

https://binance-docs.github.io/apidocs/spot/en/#deposit-history-supporting-network-user_data

Parameters

- coin (str) optional
- startTime (long) optional
- endTime (long) optional
- offset (long) optional default:0
- limit (long) optional
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

(continues on next page)

Raises BinanceRequestException, BinanceAPIException

get_dust_log(**params)

Get log of small amounts exchanged for BNB.

https://binance-docs.github.io/apidocs/spot/en/#dustlog-sapi-user_data

Parameters

- startTime (int) optional
- endTime (int) optional
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

```
"total": 8,

   "withAreaLimitation": False
```

Parameters

- **symbol** (str) Name of symbol pair e.g BNBBTC
- interval (str) Binance Kline interval
- start_str(str/int) Start date string in UTC format or timestamp in milliseconds
- end_str (str/int) optional end date string in UTC format or timestamp in milliseconds (default will fetch everything up to now)
- limit (int) Default 500; max 1000.
- klines_type (HistoricalKlinesType) Historical klines type: SPOT or FUTURES

Returns list of OHLCV values

Get Historical Klines generator from Binance

Parameters

- **symbol** (str) Name of symbol pair e.g BNBBTC
- interval (str) Binance Kline interval
- start_str(str/int) Start date string in UTC format or timestamp in milliseconds
- end_str (str/int) optional end date string in UTC format or timestamp in milliseconds (default will fetch everything up to now)

• klines_type (HistoricalKlinesType) - Historical klines type: SPOT or FUTURES

Returns generator of OHLCV values

```
\texttt{get\_historical\_trades} \; (**params) \; \rightarrow Dict[KT, VT]
```

Get older trades.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#old-trade-lookup

Parameters

- symbol (str) required
- limit (int) Default 500; max 500.
- **fromId** (str) TradeId to fetch from. Default gets most recent trades.

Returns API response

```
[
    "id": 28457,
    "price": "4.00000100",
    "qty": "12.00000000",
    "time": 1499865549590,
    "isBuyerMaker": true,
    "isBestMatch": true
}
```

Raises BinanceRequestException, BinanceAPIException

get_isolated_margin_account(**params)

Query isolated margin account details

https://binance-docs.github.io/apidocs/spot/en/#query-isolated-margin-account-info-user_data

Parameters symbols – optional up to 5 margin pairs as a comma separated string

```
account_info = client.get_isolated_margin_account()
account_info = client.get_isolated_margin_account(symbols="BTCUSDT,ETHUSDT")
```

Returns API response

(continues on next page)

get_isolated_margin_symbol(**params)

Query isolated margin symbol info

https://binance-docs.github.io/apidocs/spot/en/#query-isolated-margin-symbol-user_data

Parameters symbol (str) – name of the symbol pair

```
pair_details = client.get_isolated_margin_symbol(symbol='BTCUSDT')
```

Returns API response

```
{
"symbol":"BTCUSDT",
"base":"BTC",
"quote":"USDT",
"isMarginTrade":true,
"isBuyAllowed":true,
"isSellAllowed":true
}
```

Raises BinanceRequestException, BinanceAPIException

```
get_klines(**params) \rightarrow Dict[KT, VT]
```

Kline/candlestick bars for a symbol. Klines are uniquely identified by their open time.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#klinecandlestick-data

Parameters

- **symbol** (*str*) required
- interval (str)-

_

• limit (int) -

- Default 500; max 500.
- startTime (int) -
- endTime (int) -

Returns API response

```
[
   1499040000000, # Open time
"0.01634790", # Open
   "0.80000000",

        "locked": "0.0000000",
        "netAsset": "0.00000000"
    }
]
```

Raises BinanceRequestException, BinanceAPIException

get_margin_asset (**params)

Query cross-margin asset

https://binance-docs.github.io/apidocs/spot/en/#query-margin-asset-market_data

Parameters asset (str) – name of the asset

```
asset_details = client.get_margin_asset(asset='BNB')
```

Returns API response

```
"assetFullName": "Binance Coin",
   "assetName": "BNB",
   "isBorrowable": false,
   "isMortgageable": true,
   "userMinBorrow": "0.00000000",
   "userMinRepay": "0.00000000"
}
```

Raises BinanceRequestException, BinanceAPIException

```
get_margin_loan_details(**params)
```

Query loan record

txId or startTime must be sent. txId takes precedence.

https://binance-docs.github.io/apidocs/spot/en/#query-loan-record-user_data

Parameters

- **asset** (str) required
- **isolatedSymbol** (str) isolated symbol (if querying isolated margin)
- txId (str) the tranId in of the created loan
- **startTime** (str) earliest timestamp to filter transactions
- **endTime** (str) Used to uniquely identify this cancel. Automatically generated by default.
- **current** (str) Currently querying page. Start from 1. Default:1
- **size** (*int*) Default:10 Max:100
- recvWindow (int) the number of milliseconds the request is valid for

Returns

```
get_margin_order(**params)
```

Query margin accounts order

Either orderId or origClientOrderId must be sent.

For some historical orders cummulativeQuoteQty will be < 0, meaning the data is not available at this time.

https://binance-docs.github.io/apidocs/spot/en/#query-margin-account-39-s-order-user data

Parameters

- symbol (str) required
- **isIsolated** (str) set to 'TRUE' for isolated margin (default 'FALSE')
- orderId(str)-
- origClientOrderId(str)-
- recvWindow (int) the number of milliseconds the request is valid for

Returns

```
API response
```

```
{ "clientOrderId": "ZwfQzuDIGpceVhKW5DvCmO", "cummulativeQuoteQty": "0.00000000", "executedQty": "0.00000000", "icebergQty": "0.00000000", "isWorking": true, "orderId": 213205622, "origQty": "0.30000000", "price": "0.00493630", "side": "SELL", "status": "NEW", "stopPrice": "0.00000000", "symbol": "BNBBTC", "time": 1562133008725, "timeInForce": "GTC", "type": "LIMIT", "updateTime": 1562133008725
```

Raises BinanceRequestException, BinanceAPIException

```
get_margin_price_index(**params)
```

Query margin priceIndex

https://binance-docs.github.io/apidocs/spot/en/#query-margin-priceindex-market_data

Parameters symbol (str) – name of the symbol pair

```
price_index_details = client.get_margin_price_index(symbol='BTCUSDT')
```

Returns API response

```
{
    "calcTime": 1562046418000,
    "price": "0.00333930",
    "symbol": "BNBBTC"
}
```

Raises BinanceRequestException, BinanceAPIException

```
get_margin_repay_details(**params)
```

Query repay record

txId or startTime must be sent. txId takes precedence.

https://binance-docs.github.io/apidocs/spot/en/#query-repay-record-user_data

Parameters

- asset (str) required
- **isolatedSymbol** (str) isolated symbol (if querying isolated margin)
- txId (str) the trankd in of the created loan
- startTime (str) -
- endTime (str) Used to uniquely identify this cancel. Automatically generated by default.
- **current** (str) Currently querying page. Start from 1. Default:1
- **size** (*int*) Default:10 Max:100
- recvWindow (int) the number of milliseconds the request is valid for

Returns

Raises BinanceRequestException, BinanceAPIException

```
get_margin_symbol(**params)
```

Query cross-margin symbol info

https://binance-docs.github.io/apidocs/spot/en/#query-cross-margin-pair-market_data

Parameters symbol (str) – name of the symbol pair

```
pair_details = client.get_margin_symbol(symbol='BTCUSDT')
```

Returns API response

```
"id":323355778339572400,
"symbol":"BTCUSDT",
"base":"BTC",
"quote":"USDT",
"isMarginTrade":true,
"isBuyAllowed":true,
"isSellAllowed":true
}
```

```
get_margin_trades (**params)
```

Query margin accounts trades

If fromId is set, it will get orders >= that fromId. Otherwise most recent orders are returned.

https://binance-docs.github.io/apidocs/spot/en/#query-margin-account-39-s-trade-list-user data

Parameters

- **symbol** (str) required
- isIsolated (str) set to 'TRUE' for isolated margin (default 'FALSE')
- fromId(str) optional
- startTime (str) optional
- endTime (str) optional
- limit (int) Default 500; max 1000
- recvWindow (int) the number of milliseconds the request is valid for

Returns

```
API response

[

{ "commission": "0.00006000", "commissionAsset": "BTC", "id": 34, "is-BestMatch": true, "isBuyer": false, "isMaker": false, "orderId": 39324, "price": "0.02000000", "qty": "3.00000000", "symbol": "BNBBTC", "time": 1561973357171

}, { "commission": "0.00002950", "commissionAsset": "BTC", "id": 32, "is-BestMatch": true, "isBuyer": false, "isMaker": true, "orderId": 39319, "price": "0.00590000", "qty": "5.00000000", "symbol": "BNBBTC", "time": 1561964645345

}
```

Raises BinanceRequestException, BinanceAPIException

get_max_margin_loan(**params)

Query max borrow amount for an asset

https://binance-docs.github.io/apidocs/spot/en/#query-max-borrow-user data

Parameters

- asset (str) required
- isolatedSymbol (str) isolated symbol (if querying isolated margin)
- recvWindow (int) the number of milliseconds the request is valid for

Returns

```
API response { "amount": "1.69248805" }
```

```
get_max_margin_transfer(**params)
```

Query max transfer-out amount

https://binance-docs.github.io/apidocs/spot/en/#query-max-transfer-out-amount-user_data

Parameters

- asset (str) required
- **isolatedSymbol** (*str*) isolated symbol (if querying isolated margin)
- recvWindow (int) the number of milliseconds the request is valid for

Returns

```
API response { "amount": "3.59498107" }
```

Raises BinanceRequestException, BinanceAPIException

```
get_my_trades(**params)
```

Get trades for a specific symbol.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#account-trade-list-user_data

Parameters

- **symbol** (str) required
- limit (int) Default 500; max 500.
- **fromId** (*int*) TradeId to fetch from. Default gets most recent trades.
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

```
[
    "id": 28457,
    "price": "4.00000100",
    "qty": "12.000000000",
    "commission": "10.100000000",
    "commissionAsset": "BNB",
    "time": 1499865549590,
    "isBuyer": true,
    "isMaker": false,
    "isBestMatch": true
}
```

Raises BinanceRequestException, BinanceAPIException

```
get_open_margin_orders(**params)
```

Query margin accounts open orders

If the symbol is not sent, orders for all symbols will be returned in an array (cross-margin only).

If querying isolated margin orders, both the isIsolated='TRUE' and symbol=symbol_name must be set.

When all symbols are returned, the number of requests counted against the rate limiter is equal to the number of symbols currently trading on the exchange.

https://binance-docs.github.io/apidocs/spot/en/#query-margin-account-39-s-open-order-user_data

Parameters

- symbol (str) optional
- **isIsolated** (*str*) set to 'TRUE' for isolated margin (default 'FALSE')
- recvWindow (int) the number of milliseconds the request is valid for

Returns

```
API response

[

{ "clientOrderId": "qhcZw71gAkCCTv0t0k8LUK", "cummulativeQuoteQty": "0.00000000", "executedQty": "0.00000000", "icebergQty": "0.00000000", "isWorking": true, "orderId": 211842552, "origQty": "0.30000000", "price": "0.00475010", "side": "SELL", "status": "NEW", "stopPrice": "0.00000000", "symbol": "BNBBTC", "time": 1562040170089, "timeInForce": "GTC", "type": "LIMIT", "updateTime": 1562040170089

}
```

Raises BinanceRequestException, BinanceAPIException

```
get_open_orders (**params)
```

Get all open orders on a symbol.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#current-open-orders-user_data

Parameters

- symbol (str) optional
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

```
[
    "symbol": "LTCBTC",
    "orderId": 1,
    "clientOrderId": "myOrder1",
    "price": "0.1",
    "origQty": "1.0",
    "executedQty": "0.0",
    "status": "NEW",
    "timeInForce": "GTC",
    "type": "LIMIT",
    "side": "BUY",
    "stopPrice": "0.0",
    "icebergQty": "0.0",
    "time": 1499827319559
}
]
```

```
get_order (**params)
```

Check an order's status. Either orderId or origClientOrderId must be sent.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#query-order-user_data

Parameters

- **symbol** (str) required
- orderId (int) The unique order id
- origClientOrderId (str) optional
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

```
"symbol": "LTCBTC",
    "orderId": 1,
    "clientOrderId": "myOrder1",
    "price": "0.1",
    "origQty": "1.0",
    "executedQty": "0.0",
    "status": "NEW",
    "timeInForce": "GTC",
    "type": "LIMIT",
    "side": "BUY",
    "stopPrice": "0.0",
    "icebergQty": "0.0",
    "time": 1499827319559
}
```

Raises BinanceRequestException, BinanceAPIException

```
get\_order\_book(**params) \rightarrow Dict[KT, VT]
```

Get the Order Book for the market

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#order-book

Parameters

- **symbol** (str) required
- limit (int) Default 100; max 1000

Returns API response

(continues on next page)

```
"4.00000200",
"12.00000000",
[]
]
```

Raises BinanceRequestException, BinanceAPIException

```
get_orderbook_ticker(**params)
```

Latest price for a symbol or symbols.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#symbol-order-book-ticker

Parameters symbol (str) -

Returns API response

```
{
    "symbol": "LTCBTC",
    "bidPrice": "4.00000000",
    "bidQty": "431.00000000",
    "askPrice": "4.0000200",
    "askQty": "9.00000000"
}
```

OR

Raises BinanceRequestException, BinanceAPIException

```
\texttt{get\_orderbook\_tickers}\,(\,)\,\to Dict[KT,\,VT]
```

Best price/qty on the order book for all symbols.

https://binance-docs.github.io/apidocs/spot/en/#symbol-order-book-ticker

Parameters symbol (str) – optional

Returns List of order book market entries

```
\mathtt{get\_products}() \rightarrow \mathrm{Dict}[\mathrm{KT},\mathrm{VT}]
```

Return list of products currently listed on Binance

Use get_exchange_info() call instead

Returns list - List of product dictionaries

Raises BinanceRequestException, BinanceAPIException

```
\texttt{get\_recent\_trades} (**params) \rightarrow Dict[KT, VT]
```

Get recent trades (up to last 500).

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#recent-trades-list

Parameters

- **symbol** (str) required
- limit (int) Default 500; max 500.

Returns API response

Raises BinanceRequestException, BinanceAPIException

```
\texttt{get\_server\_time}\,(\,)\,\to Dict[KT,\,VT]
```

Test connectivity to the Rest API and get the current server time.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#check-server-time

Returns Current server time

```
{
    "serverTime": 1499827319559
}
```

```
get_sub_account_assets(**params)
```

Fetch sub-account assets

https://binance-docs.github.io/apidocs/spot/en/#query-sub-account-assets-sapi-for-master-account

Parameters

- email (str) required
- recvWindow (int) optional

Returns API response

```
"balances":[
    {
        "asset": "ADA",
        "free":10000,
        "locked":0
    },
        "asset": "BNB",
        "free":10003,
        "locked":0
    },
        "asset": "BTC",
        "free":11467.6399,
        "locked":0
    },
        "asset":"ETH",
        "free":10004.995,
        "locked":0
    },
        "asset":"USDT",
        "free":11652.14213,
        "locked":0
]
```

Raises BinanceRequestException, BinanceAPIException

get_sub_account_futures_transfer_history(**params)

Query Sub-account Futures Transfer History.

https://binance-docs.github.io/apidocs/spot/en/#query-sub-account-futures-asset-transfer-history-for-master-account

Parameters

• email (str) - required

- futuresType (int) required
- startTime (int) optional
- endTime (int) optional
- page (int) optional
- limit (int) optional
- recvWindow (int) optional

Returns API response

```
"success":true,
"futuresType": 2,
"transfers":[
    {
        "from": "aaa@test.com",
        "to": "bbb@test.com",
        "asset":"BTC",
        "qty":"1",
        "time":1544433328000
    },
        "from": "bbb@test.com",
        "to":"ccc@test.com",
        "asset":"ETH",
        "qty":"2",
        "time":1544433328000
]
```

Raises BinanceRequestException, BinanceAPIException

get_sub_account_list(**params)

Query Sub-account List.

https://binance-docs.github.io/apidocs/spot/en/#query-sub-account-list-sapi-for-master-account

Parameters

- email (str) optional Sub-account email
- isFreeze (str) optional
- page (int) optional Default value: 1
- limit (int) optional Default value: 1, Max value: 200
- recvWindow (int) optional

Returns API response

(continues on next page)

```
},
{
    "email":"virtual@oxebmvfonoemail.com",
    "isFreeze":false,
    "createTime":1544433328000
}
```

Raises BinanceRequestException, BinanceAPIException

```
get_sub_account_transfer_history(**params)
```

Query Sub-account Transfer History.

https://binance-docs.github.io/apidocs/spot/en/#query-sub-account-spot-asset-transfer-history-sapi-for-master-account

Parameters

- fromEmail (str) optional
- toEmail (str) optional
- startTime (int) optional
- endTime (int) optional
- page (int) optional Default value: 1
- limit (int) optional Default value: 500
- recvWindow (int) optional

Returns API response

```
{
    "from": "aaa@test.com",
    "to": "bbb@test.com",
    "asset":"BTC",
    "qty":"10",
    "status": "SUCCESS",
    "tranId": 6489943656,
    "time":1544433328000
},
    "from": "bbb@test.com",
    "to": "ccc@test.com",
    "asset":"ETH",
    "qty":"2",
    "status": "SUCCESS",
    "tranId": 6489938713,
    "time":1544433328000
}
```

Raises BinanceRequestException, BinanceAPIException

```
get_subaccount_deposit_address(**params)
```

Get Sub-account Deposit Address (For Master Account)

https://binance-docs.github.io/apidocs/spot/en/#get-sub-account-deposit-address-for-master-account

Parameters

- email (str) required Sub account email
- coin (str) required
- network (str) optional
- recvWindow (int) optional

Returns API response

```
{
    "address":"TDunhSa7jkTNuKrusUTU1MUHtqXoBPKETV",
    "coin":"USDT",
    "tag":"",
    "url":"https://tronscan.org/#/address/TDunhSa7jkTNuKrusUTU1MUHtqXoBPKETV
    "
}
```

Raises BinanceRequestException, BinanceAPIException

get subaccount deposit history(**params)

Get Sub-account Deposit History (For Master Account)

https://binance-docs.github.io/apidocs/spot/en/#get-sub-account-deposit-address-for-master-account

Parameters

- email (str) required Sub account email
- coin (str) optional
- **status** (*int*) optional (0:pending,6: credited but cannot withdraw, 1:success)
- startTime (int) optional
- endTime (int) optional
- limit (int) optional
- offset (int) optional default:0
- recvWindow (int) optional

Returns API response

(continues on next page)

```
{
    "amount":"0.50000000",
    "coin":"IOTA",
    "network":"IOTA",
    "status":1,

    "insertTime":1599620082000,
    "transferType":0,
    "confirmTimes":"1/1"
    }
}
```

Raises BinanceRequestException, BinanceAPIException

get_subaccount_futures_details(**params)

Get Detail on Sub-account's Futures Account (For Master Account)

https://binance-docs.github.io/apidocs/spot/en/#get-detail-on-sub-account-39-s-futures-account-for-master-account

Parameters

- email (str) required Sub account email
- recvWindow (int) optional

Returns API response

```
"email": "abc@test.com",
"asset": "USDT",
"assets":[
        "asset": "USDT",
        "initialMargin": "0.00000000",

}
```

Raises BinanceRequestException, BinanceAPIException

get_subaccount_futures_margin_status(**params)

Get Sub-account's Status on Margin/Futures (For Master Account)

https://binance-docs.github.io/apidocs/spot/en/#get-sub-account-39-s-status-on-margin-futures-for-master-account

Parameters

- email (str) optional Sub account email
- recvWindow (int) optional

Returns API response

Raises BinanceRequestException, BinanceAPIException

get_subaccount_futures_positionrisk(**params)

Get Futures Position-Risk of Sub-account (For Master Account)

https://binance-docs.github.io/apidocs/spot/en/#get-futures-position-risk-of-sub-account-for-master-account

Parameters

- email (str) required Sub account email
- recvWindow (int) optional

Returns API response

(continues on next page)

```
"unrealizedProfit": "-0.01612295"
}
```

Raises BinanceRequestException, BinanceAPIException

```
get subaccount futures summary(**params)
```

Get Summary of Sub-account's Futures Account (For Master Account)

https://binance-docs.github.io/apidocs/spot/en/#get-summary-of-sub-account-39-s-futures-account-for-master-account

Parameters recvWindow (int) - optional

Returns API response

```
"totalInitialMargin": "9.83137400",
"totalMaintenanceMargin": "0.41568700",
"totalMarginBalance": "23.03235621",

     1
```

Raises BinanceRequestException, BinanceAPIException

get_subaccount_margin_summary(**params)

Get Summary of Sub-account's Margin Account (For Master Account)

https://binance-docs.github.io/apidocs/spot/en/#get-summary-of-sub-account-39-s-margin-account-for-master-account

Parameters recvWindow (int) - optional

Returns API response

Raises BinanceRequestException, BinanceAPIException

get_subaccount_transfer_history(**params)

Sub-account Transfer History (For Sub-account)

https://binance-docs.github.io/apidocs/spot/en/#transfer-to-master-for-sub-account

Parameters

- **asset** (str) required The asset being transferred, e.g., USDT
- type (int) optional 1: transfer in, 2: transfer out
- startTime (int) optional
- endTime (int) optional
- limit (int) optional Default 500
- recvWindow (int) optional

Returns API response

```
"counterParty":"master",
   "email":"master@test.com",
   "type":1, // 1 for transfer in, 2 for transfer out
   "asset":"BTC",
   "qty":"1",
   "status":"SUCCESS",
   "tranId":11798835829,
```

(continues on next page)

```
"time":1544433325000

},

{
    "counterParty":"subAccount",
    "email":"sub2@test.com",
    "type":2,
    "asset":"ETH",
    "qty":"2",
    "status":"SUCCESS",
    "tranId":11798829519,
    "time":1544433326000

}
```

Raises BinanceRequestException, BinanceAPIException

```
\texttt{get\_symbol\_info}(symbol) \rightarrow \text{Optional[Dict[KT, VT]]}
Return information about a symbol
```

Parameters symbol (str) – required e.g BNBBTC

Returns Dict if found, None if not

```
"symbol": "ETHBTC",
"status": "TRADING",
"baseAsset": "ETH",
"baseAssetPrecision": 8,
"quoteAsset": "BTC",
"quotePrecision": 8,
"orderTypes": ["LIMIT", "MARKET"],
"icebergAllowed": false,
"filters": [
        "filterType": "PRICE_FILTER",
        "minPrice": "0.00000100",

        "tickSize": "0.0000100"
    }, {
        "filterType": "LOT_SIZE",
        "minQty": "0.00100000",
        "maxQty": "100000.00000000",
        "stepSize": "0.00100000"
        "filterType": "MIN_NOTIONAL",
        "minNotional": "0.00100000"
]
```

Raises BinanceRequestException, BinanceAPIException

```
get_symbol_ticker(**params)
```

Latest price for a symbol or symbols.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md# 24hr-ticker-price-change-statistics

Parameters symbol (str) -

Returns API response

```
{
    "symbol": "LTCBTC",
    "price": "4.00000200"
}
```

OR

Raises BinanceRequestException, BinanceAPIException

get_system_status()

Get system status detail.

https://binance-docs.github.io/apidocs/spot/en/#system-status-sapi-system

Returns API response

```
{
   "status": 0,  # 0: normal1system maintenance
   "msg": "normal"  # normal or System maintenance.
}
```

Raises BinanceAPIException

get_ticker(**params)

24 hour price change statistics.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md# 24hr-ticker-price-change-statistics

Parameters symbol (str) -

Returns API response

```
{
    "priceChange": "-94.99999800",
    "priceChangePercent": "-95.960",
    "weightedAvgPrice": "0.29628482",

                    # Last tradeId
```

Raises BinanceRequestException, BinanceAPIException

```
get_trade_fee(**params)
```

Get trade fee.

https://binance-docs.github.io/apidocs/spot/en/#trade-fee-sapi-user_data

Parameters

- **symbol** (str) optional
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

(continues on next page)

```
]
```

Raises BinanceWithdrawException

```
get_universal_transfer_history(**params)
```

Universal Transfer (For Master Account)

https://binance-docs.github.io/apidocs/spot/en/#query-universal-transfer-history

Parameters

- fromEmail (str) optional
- toEmail (str) optional
- startTime (int) optional
- endTime (int) optional
- page (int) optional
- limit (int) optional
- recvWindow (int) optional

Returns API response

```
{
  "tranId":11945860693,

  "status": "SUCCESS",
  "createTimeStamp":1544433326000
}
```

Raises BinanceRequestException, BinanceAPIException

get_withdraw_history(**params)

Fetch withdraw history.

https://binance-docs.github.io/apidocs/spot/en/#withdraw-history-supporting-network-user_data

Parameters

- coin (str) optional
- offset (int) optional default:0
- limit (int) optional
- **startTime** (*int*) optional Default: 90 days from current timestamp
- endTime (int) optional Default: present timestamp
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

```

   }
```

Raises BinanceRequestException, BinanceAPIException

get_withdraw_history_id (withdraw_id, **params)

Fetch withdraw history.

https://binance-docs.github.io/apidocs/spot/en/#withdraw-history-supporting-network-user_data

Parameters

- withdraw_id (str) required
- asset (str) optional
- startTime (long) optional
- endTime (long) optional
- recvWindow (int) the number of milliseconds the request is valid for

```
{
    "id":"7213fea8e94b4a5593d507237e5a555b",
    "withdrawOrderId": None,
    "amount": 0.99,
    "transactionFee": 0.01,
    "address": "0x6915f16f8791d0a1cc2bf47c13a6b2a92000504b",
    "asset": "ETH",
    "txId":
    →"0xdf33b22bdb2b28b1f75ccd201a4a4m6e7g83jy5fc5d5a9d1340961598cfcb0a1",
    "applyTime": 1508198532000,
    "status": 4
}
```

Raises BinanceRequestException, BinanceAPIException

isolated_margin_stream_close(symbol, listenKey)

Close out an isolated margin data stream.

https://binance-docs.github.io/apidocs/spot/en/#listen-key-isolated-margin

Parameters

- **symbol** (str) required symbol for the isolated margin account
- listenKey (str) required

Returns API response

```
{}
```

Raises BinanceRequestException, BinanceAPIException

isolated_margin_stream_get_listen_key(symbol)

Start a new isolated margin data stream and return the listen key If a stream already exists it should return the same key. If the stream becomes invalid a new key is returned.

Can be used to keep the stream alive.

https://binance-docs.github.io/apidocs/spot/en/#listen-key-isolated-margin

Parameters symbol (str) – required - symbol for the isolated margin account

Returns API response

```
{
    "listenKey":
    →"T3ee22BIYuWqmvne0HNq2A2WsFlEtLhvWCtItw6ffhhdmjifQ2tRbuKkTHhr"
}
```

Raises BinanceRequestException, BinanceAPIException

isolated_margin_stream_keepalive (symbol, listenKey)

PING an isolated margin data stream to prevent a time out.

https://binance-docs.github.io/apidocs/spot/en/#listen-key-isolated-margin

Parameters

- **symbol** (str) required symbol for the isolated margin account
- listenKey (str) required

```
{ }
```

Raises BinanceRequestException, BinanceAPIException

make_subaccount_futures_transfer(**params)

Futures Transfer for Sub-account (For Master Account)

https://binance-docs.github.io/apidocs/spot/en/#futures-transfer-for-sub-account-for-master-account

Parameters

- email (str) required Sub account email
- **asset** (str) required The asset being transferred, e.g., USDT
- amount (float) required The amount to be transferred
- type (int) required 1: transfer from subaccount's spot account to its USDT-margined futures account 2: transfer from subaccount's USDT-margined futures account to its spot account 3: transfer from subaccount's spot account to its COIN-margined futures account to its spot account 4: transfer from subaccount's COIN-margined futures account to its spot account

Returns API response

```
{
    "txnId":"2966662589"
}
```

Raises BinanceRequestException, BinanceAPIException

make_subaccount_margin_transfer(**params)

Margin Transfer for Sub-account (For Master Account)

https://binance-docs.github.io/apidocs/spot/en/#margin-transfer-for-sub-account-for-master-account

Parameters

- **email** (str) required Sub account email
- **asset** (str) required The asset being transferred, e.g., USDT
- amount (float) required The amount to be transferred
- **type** (*int*) required 1: transfer from subaccount's spot account to margin account 2: transfer from subaccount's margin account to its spot account

Returns API response

```
{
    "txnId":"2966662589"
}
```

Raises BinanceRequestException, BinanceAPIException

make_subaccount_to_master_transfer(**params)

Transfer to Master (For Sub-account)

https://binance-docs.github.io/apidocs/spot/en/#transfer-to-master-for-sub-account

Parameters

- **asset** (str) required The asset being transferred, e.g., USDT
- amount (float) required The amount to be transferred
- recvWindow (int) optional

Returns API response

```
{
    "txnId":"2966662589"
}
```

Raises BinanceRequestException, BinanceAPIException

make_subaccount_to_subaccount_transfer(**params)

Transfer to Sub-account of Same Master (For Sub-account)

https://binance-docs.github.io/apidocs/spot/en/#transfer-to-sub-account-of-same-master-for-sub-account

Parameters

- toEmail (str) required Sub account email
- asset (str) required The asset being transferred, e.g., USDT
- amount (float) required The amount to be transferred
- recvWindow (int) optional

Returns API response

```
{
    "txnId":"2966662589"
}
```

Raises BinanceRequestException, BinanceAPIException

make_subaccount_universal_transfer(**params)

Universal Transfer (For Master Account)

https://binance-docs.github.io/apidocs/spot/en/#universal-transfer-for-master-account

Parameters

- fromEmail (str) optional
- toEmail (str) optional
- fromAccountType (str) required "SPOT", "USDT_FUTURE", "COIN_FUTURE"
- toAccountType (str)-required "SPOT","USDT_FUTURE","COIN_FUTURE"
- asset (str) required The asset being transferred, e.g., USDT
- amount (float) required
- recvWindow (int) optional

```
{
    "tranId":11945860693
}
```

Raises BinanceRequestException, BinanceAPIException

make_universal_transfer(**params)

User Universal Transfer

https://binance-docs.github.io/apidocs/spot/en/#user-universal-transfer

Parameters

- type (str (ENUM)) required
- asset (str) required
- amount (str) required
- recvWindow (int) the number of milliseconds the request is valid for

```
transfer_status = client.make_universal_transfer(params)
```

Returns API response

```
{
    "tranId":13526853623
}
```

Raises BinanceRequestException, BinanceAPIException

margin_stream_close(listenKey)

Close out a cross-margin data stream.

https://binance-docs.github.io/apidocs/spot/en/#listen-key-margin

```
Parameters listenKey (str) - required
```

Returns API response

```
{}
```

Raises BinanceRequestException, BinanceAPIException

margin_stream_get_listen_key()

Start a new cross-margin data stream and return the listen key If a stream already exists it should return the same key. If the stream becomes invalid a new key is returned.

Can be used to keep the stream alive.

https://binance-docs.github.io/apidocs/spot/en/#listen-key-margin

Returns API response

```
{
    "listenKey":
    →"pqia91ma19a5s61cv6a81va65sdf19v8a65a1a5s61cv6a81va65sdf19v8a65a1"
}
```

Raises BinanceRequestException, BinanceAPIException

margin_stream_keepalive(listenKey)

PING a cross-margin data stream to prevent a time out.

https://binance-docs.github.io/apidocs/spot/en/#listen-key-margin

Parameters listenKey (str) – required

Returns API response

{ }

Raises BinanceRequestException, BinanceAPIException

new_transfer_history(**params)

Get future account transaction history list

https://binance-docs.github.io/apidocs/delivery/en/#new-future-account-transfer

options_account_info(**params)

Account asset info (USER_DATA)

https://binance-docs.github.io/apidocs/voptions/en/#account-asset-info-user_data

Parameters recvWindow (int) - optional

```
options bill(**params)
```

Account funding flow (USER_DATA)

https://binance-docs.github.io/apidocs/voptions/en/#account-funding-flow-user_data

Parameters

- **currency** (str) required Asset type USDT
- recordId (int) optional Return the recordId and subsequent data, the latest data is returned by default 100000
- startTime (int) optional Start Time 1593511200000
- endTime (int) optional End Time 1593511200000
- limit (int) optional Number of result sets returned Default:100 Max:1000 -100
- recvWindow (int) optional

options_cancel_all_orders(**params)

Cancel all Option orders (TRADE)

https://binance-docs.github.io/apidocs/voptions/en/#cancel-all-option-orders-trade

Parameters

- **symbol** (str) required Option trading pair BTC-200730-9000-C
- recvWindow (int) optional

options_cancel_batch_order(**params)

Cancel Multiple Option orders (TRADE)

https://binance-docs.github.io/apidocs/voptions/en/#cancel-multiple-option-orders-trade

Parameters

- **symbol** (str) required Option trading pair BTC-200730-9000-C
- orderIds optional Order ID [4611875134427365377,4611875134427365378]
- clientOrderIds (list) optional User-defined order ID ["my_id_1","my_id_2"]
- recvWindow (int) optional

options_cancel_order(**params)

Cancel Option order (TRADE)

https://binance-docs.github.io/apidocs/voptions/en/#cancel-option-order-trade

Parameters

- symbol (str) required Option trading pair BTC-200730-9000-C
- orderId (str) optional Order ID 4611875134427365377
- clientOrderId (str) optional User-defined order ID 10000
- recvWindow (int) optional

options_exchange_info()

Get current limit info and trading pair info

https://binance-docs.github.io/apidocs/voptions/en/#get-current-limit-info-and-trading-pair-info

options_funds_transfer(**params)

Funds transfer (USER DATA)

https://binance-docs.github.io/apidocs/voptions/en/#funds-transfer-user_data

Parameters

- **currency** (str) required Asset type USDT
- **type** (str (ENUM)) required IN: Transfer from spot account to option account OUT: Transfer from option account to spot account IN
- amount (float) required Amount 10000
- recvWindow (int) optional

options_historical_trades(**params)

Query trade history

https://binance-docs.github.io/apidocs/voptions/en/#query-trade-history

Parameters

- symbol (str) required Option trading pair BTC-200730-9000-C
- **fromId** (*int*) optional The deal ID from which to return. The latest deal record is returned by default 1592317127349
- limit (int) optional Number of records Default:100 Max:500 100

options_index_price(**params)

Get the spot index price

https://binance-docs.github.io/apidocs/voptions/en/#get-the-spot-index-price

Parameters underlying (str) – required - Spot pairOption contract underlying asset-BTCUSDT

options_info()

Get current trading pair info

https://binance-docs.github.io/apidocs/voptions/en/#get-current-trading-pair-info

options_klines(**params)

Candle data

https://binance-docs.github.io/apidocs/voptions/en/#candle-data

Parameters

- symbol (str) required Option trading pair BTC-200730-9000-C
- interval (str) required Time interval 5m
- **startTime** (*int*) optional Start Time 1592317127349
- endTime (int) optional End Time 1592317127349
- limit (int) optional Number of records Default:500 Max:1500 500

options_mark_price(**params)

Get the latest mark price

https://binance-docs.github.io/apidocs/voptions/en/#get-the-latest-mark-price

Parameters symbol (str) – optional - Option trading pair - BTC-200730-9000-C

options_order_book (**params)

Depth information

https://binance-docs.github.io/apidocs/voptions/en/#depth-information

Parameters

- **symbol** (str) required Option trading pair BTC-200730-9000-C
- limit (int) optional Default:100 Max:1000.Optional value:[10, 20, 50, 100, 500, 1000] 100

options_ping()

Test connectivity

https://binance-docs.github.io/apidocs/voptions/en/#test-connectivity

options_place_batch_order(**params)

Place Multiple Option orders (TRADE)

https://binance-docs.github.io/apidocs/voptions/en/#place-multiple-option-orders-trade

Parameters

- orders (list) required order list. Max 5 orders [{"symbol":"BTC-210115-35000-C","price":"100","quantity":"0.0001","side":"BUY","type":"LIMIT"}]
- recvWindow (int) optional

```
options_place_order(**params)
```

Option order (TRADE)

https://binance-docs.github.io/apidocs/voptions/en/#option-order-trade

Parameters

- symbol (str) required Option trading pair BTC-200730-9000-C
- side (str (ENUM)) required Buy/sell direction: SELL, BUY BUY
- type (str (ENUM)) required Order Type: LIMIT, MARKET LIMIT
- quantity (float) required Order Quantity 3
- price (float) optional Order Price 1000
- timeInForce (str (ENUM)) optional Time in force methodDefault GTC) GTC
- reduceOnly (bool) optional Reduce Only (Default false) false
- postOnly (bool) optional Post Only (Default false) false
- newOrderRespType (str (ENUM)) optional "ACK", "RESULT", Default "ACK" ACK
- **clientOrderId** (str) optional User-defined order ID cannot be repeated in pending orders 10000
- recvWindow (int) optional

options_positions(**params)

Option holdings info (USER_DATA)

https://binance-docs.github.io/apidocs/voptions/en/#option-holdings-info-user_data

Parameters

- symbol (str) optional Option trading pair BTC-200730-9000-C
- recvWindow (int) optional

```
options_price(**params)
```

Get the latest price

https://binance-docs.github.io/apidocs/voptions/en/#get-the-latest-price

Parameters symbol (str) – optional - Option trading pair - BTC-200730-9000-C

```
options_query_order(**params)
```

Query Option order (TRADE)

https://binance-docs.github.io/apidocs/voptions/en/#query-option-order-trade

Parameters

- **symbol** (str) required Option trading pair BTC-200730-9000-C
- orderId (str) optional Order ID 4611875134427365377
- clientOrderId (str) optional User-defined order ID 10000
- recvWindow (int) optional

options_query_order_history(**params)

Query Option order history (TRADE)

https://binance-docs.github.io/apidocs/voptions/en/#query-option-order-history-trade

Parameters

- **symbol** (str) required Option trading pair BTC-200730-9000-C
- orderId (str) optional Returns the orderId and subsequent orders, the most recent order is returned by default 100000
- startTime (int) optional Start Time 1593511200000
- endTime (int) optional End Time 1593511200000
- limit (int) optional Number of result sets returned Default:100 Max:1000 -100
- recvWindow (int) optional

options_query_pending_orders(**params)

Query current pending Option orders (TRADE)

https://binance-docs.github.io/apidocs/voptions/en/#query-current-pending-option-orders-trade

Parameters

- **symbol** (str) required Option trading pair BTC-200730-9000-C
- orderId (str) optional Returns the orderId and subsequent orders, the most recent order is returned by default 100000
- startTime (int) optional Start Time 1593511200000
- endTime (int) optional End Time 1593511200000
- limit (int) optional Number of result sets returned Default:100 Max:1000 -100
- recvWindow (int) optional

options_recent_trades (**params)

Recently completed Option trades

https://binance-docs.github.io/apidocs/voptions/en/#recently-completed-option-trades

Parameters

- **symbol** (str) required Option trading pair BTC-200730-9000-C
- limit (int) optional Number of records Default:100 Max:500 100

options_time()

Get server time

https://binance-docs.github.io/apidocs/voptions/en/#get-server-time

options_user_trades (**params)

Option Trade List (USER_DATA)

https://binance-docs.github.io/apidocs/voptions/en/#option-trade-list-user_data

Parameters

- symbol (str) required Option trading pair BTC-200730-9000-C
- **fromId** optional Trade id to fetch from. Default gets most recent trades. 4611875134427365376
- startTime (int) optional Start Time 1593511200000
- endTime (int) optional End Time 1593511200000

- limit (int) optional Number of result sets returned Default:100 Max:1000 100
- recvWindow (int) optional

order_limit (timeInForce='GTC', **params)

Send in a new limit order

Any order with an icebergQty MUST have timeInForce set to GTC.

Parameters

- **symbol** (str) required
- **side** (str) required
- quantity (decimal) required
- price (str) required
- timeInForce (str) default Good till cancelled
- newClientOrderId (str) A unique id for the order. Automatically generated if not sent.
- icebergQty (decimal) Used with LIMIT, STOP_LOSS_LIMIT, and TAKE_PROFIT_LIMIT to create an iceberg order.
- newOrderRespType (str) Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

See order endpoint for full response options

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

```
order_limit_buy (timeInForce='GTC', **params)
```

Send in a new limit buy order

Any order with an icebergQty MUST have timeInForce set to GTC.

Parameters

- **symbol** (str) required
- quantity (decimal) required
- price (str) required
- timeInForce (str) default Good till cancelled
- newClientOrderId (str) A unique id for the order. Automatically generated
 if not sent.
- stopPrice (decimal) Used with stop orders
- icebergQty (decimal) Used with iceberg orders
- newOrderRespType (str) Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- recvWindow (int) the number of milliseconds the request is valid for

See order endpoint for full response options

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

order_limit_sell (timeInForce='GTC', **params)

Send in a new limit sell order

Parameters

- **symbol** (str) required
- quantity (decimal) required
- price (str) required
- timeInForce (str) default Good till cancelled
- newClientOrderId (str) A unique id for the order. Automatically generated if not sent.
- stopPrice (decimal) Used with stop orders
- icebergQty (decimal) Used with iceberg orders
- newOrderRespType (str) Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

See order endpoint for full response options

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

order_market (**params)

Send in a new market order

Parameters

- **symbol** (str) required
- side (str) required
- quantity (decimal) required
- **quoteOrderQty** (decimal) amount the user wants to spend (when buying) or receive (when selling) of the quote asset
- newClientOrderId (str) A unique id for the order. Automatically generated
 if not sent.
- newOrderRespType (str) Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

See order endpoint for full response options

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

order_market_buy(**params)

Send in a new market buy order

Parameters

- symbol (str) required
- quantity (decimal) required
- quoteOrderQty (decimal) the amount the user wants to spend of the quote asset
- **newClientOrderId** (str) A unique id for the order. Automatically generated if not sent.
- newOrderRespType (str) Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

See order endpoint for full response options

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

order_market_sell(**params)

Send in a new market sell order

Parameters

- **symbol** (str) required
- quantity (decimal) required
- quoteOrderQty (decimal) the amount the user wants to receive of the quote asset
- newClientOrderId (str) A unique id for the order. Automatically generated if not sent.
- newOrderRespType (str) Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

See order endpoint for full response options

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

order_oco_buy(**params)

Send in a new OCO buy order

Parameters

- **symbol** (str) required
- listClientOrderId (str) A unique id for the list order. Automatically generated if not sent.
- quantity (decimal) required
- **limitClientOrderId** (str) A unique id for the limit order. Automatically generated if not sent.
- **price** (str) required
- limitIcebergQty (decimal) Used to make the LIMIT_MAKER leg an iceberg order.
- **stopClientOrderId** (*str*) A unique id for the stop order. Automatically generated if not sent.
- stopPrice (str) required
- **stopLimitPrice** (*str*) If provided, stopLimitTimeInForce is required.
- **stopIcebergQty** (*decimal*) Used with STOP_LOSS_LIMIT leg to make an iceberg order.
- **stopLimitTimeInForce** (*str*) Valid values are GTC/FOK/IOC.
- newOrderRespType (str) Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

See OCO order endpoint for full response options

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

order_oco_sell(**params)

Send in a new OCO sell order

Parameters

- **symbol** (str) required
- **listClientOrderId** (str) A unique id for the list order. Automatically generated if not sent.
- quantity (decimal) required
- **limitClientOrderId** (*str*) A unique id for the limit order. Automatically generated if not sent.
- price (str) required
- limitIcebergQty (decimal) Used to make the LIMIT_MAKER leg an iceberg order.

- stopClientOrderId (str) A unique id for the stop order. Automatically generated if not sent.
- stopPrice (str) required
- **stopLimitPrice** (*str*) If provided, stopLimitTimeInForce is required.
- **stopIcebergQty** (decimal) Used with STOP_LOSS_LIMIT leg to make an iceberg order.
- stopLimitTimeInForce (str) Valid values are GTC/FOK/IOC.
- newOrderRespType (str) Set the response JSON. ACK, RESULT, or FULL; default: RESULT.
- recvWindow (int) the number of milliseconds the request is valid for

See OCO order endpoint for full response options

Raises BinanceRequestException, BinanceAPIException, BinanceOrderException, BinanceOrderMinAmountException, BinanceOrderMinPriceException, BinanceOrderMinTotalException, BinanceOrderUnknownSymbolException, BinanceOrderInactiveSymbolException

```
ping() \rightarrow Dict[KT, VT]
```

Test connectivity to the Rest API.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#test-connectivity

Returns Empty array

```
{}
```

Raises BinanceRequestException, BinanceAPIException

purchase_lending_product(**params)

Purchase Flexible Product

https://binance-docs.github.io/apidocs/spot/en/#purchase-flexible-product-user_data

query_subaccount_spot_summary(**params)

Query Sub-account Spot Assets Summary (For Master Account)

https://binance-docs.github.io/apidocs/spot/en/#query-sub-account-spot-assets-summary-for-master-account

Parameters

- email (str) optional Sub account email
- page (int) optional default 1
- size (int) optional default 10, max 20
- recvWindow (int) optional

Returns API response

(continues on next page)

```
"email":"sub123@test.com",
    "totalAsset":"9999.00000000"
},
{
    "email":"test456@test.com",
    "totalAsset":"0.00000000"
}
]
```

Raises BinanceRequestException, BinanceAPIException

query_universal_transfer_history(**params)

Query User Universal Transfer History

https://binance-docs.github.io/apidocs/spot/en/#query-user-universal-transfer-history

Parameters

- type (str (ENUM)) required
- startTime (int) optional
- endTime (int) optional
- current (int) optional Default 1
- size (int) required Default 10, Max 100
- recvWindow (int) the number of milliseconds the request is valid for

```
transfer_status = client.query_universal_transfer_history(params)
```

Returns API response

```
"total":2,
"rows":[
    {
        "asset":"USDT",
        "amount":"1",
        "type":"MAIN_UMFUTURE"
        "status": "CONFIRMED",
        "tranId": 11415955596,
        "timestamp":1544433328000
    },
        "asset":"USDT",
        "amount":"2",
        "type": "MAIN_UMFUTURE",
        "status": "CONFIRMED",
        "tranId": 11366865406,
        "timestamp":1544433328000
]
```

Raises BinanceRequestException, BinanceAPIException

redeem_lending_product (**params)

Redeem Flexible Product

https://binance-docs.github.io/apidocs/spot/en/#redeem-flexible-product-user_data

repay_margin_loan(**params)

Repay loan in cross-margin or isolated-margin account.

If amount is more than the amount borrowed, the full loan will be repaid.

https://binance-docs.github.io/apidocs/spot/en/#margin-account-repay-margin

Parameters

- asset (str) name of the asset
- amount (str) amount to transfer
- **isIsolated** (*str*) set to 'TRUE' for isolated margin (default 'FALSE')
- **symbol** (str) Isolated margin symbol (default blank for cross-margin)
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

```
{
    "tranId": 100000001
}
```

Raises BinanceRequestException, BinanceAPIException

stream_close(listenKey)

Close out a user data stream.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md# close-user-data-stream-user_stream

Parameters listenKey (str) - required

Returns API response

```
{}
```

Raises BinanceRequestException, BinanceAPIException

stream_get_listen_key()

Start a new user data stream and return the listen key If a stream already exists it should return the same key. If the stream becomes invalid a new key is returned.

Can be used to keep the user stream alive.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md#start-user-data-stream-user_stream

Returns API response

```
{
    "listenKey":
    →"pqia91ma19a5s61cv6a81va65sdf19v8a65a1a5s61cv6a81va65sdf19v8a65a1"
}
```

Raises BinanceRequestException, BinanceAPIException

stream_keepalive(listenKey)

PING a user data stream to prevent a time out.

https://github.com/binance/binance-spot-api-docs/blob/master/rest-api.md# keepalive-user-data-stream-user_stream

Parameters listenKey (str) - required

Returns API response

```
{}
```

Raises BinanceRequestException, BinanceAPIException

toggle_bnb_burn_spot_margin(**params)

Toggle BNB Burn On Spot Trade And Margin Interest

https://binance-docs.github.io/apidocs/spot/en/#toggle-bnb-burn-on-spot-trade-and-margin-interest-user_data

Parameters

- **spotBNBBurn** (bool) Determines whether to use BNB to pay for trading fees on SPOT
- interestBNBBurn (bool) Determines whether to use BNB to pay for margin loan's interest

```
response = client.toggle_bnb_burn_spot_margin()
```

Returns API response

```
{
    "spotBNBBurn":true,
    "interestBNBBurn": false
}
```

Raises BinanceRequestException, BinanceAPIException

transfer_dust(**params)

Convert dust assets to BNB.

https://binance-docs.github.io/apidocs/spot/en/#dust-transfer-user_data

Parameters

- asset (str) The asset being converted. e.g. 'ONE'
- recvWindow (int) the number of milliseconds the request is valid for

```
result = client.transfer_dust(asset='ONE')
```

Raises BinanceRequestException, BinanceAPIException

transfer_history(**params)

Get future account transaction history list

https://binance-docs.github.io/apidocs/futures/en/#get-future-account-transaction-history-list-user_data

transfer_isolated_margin_to_spot(**params)

Execute transfer between isolated margin account and spot account.

https://binance-docs.github.io/apidocs/spot/en/#isolated-margin-account-transfer-margin

Parameters

- **asset** (str) name of the asset
- **symbol** (str) pair symbol
- amount (str) amount to transfer
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

```
{
    "tranId": 100000001
}
```

Raises BinanceRequestException, BinanceAPIException

transfer_margin_to_spot(**params)

Execute transfer between cross-margin account and spot account.

https://binance-docs.github.io/apidocs/spot/en/#cross-margin-account-transfer-margin

Parameters

- asset (str) name of the asset
- amount (str) amount to transfer
- recvWindow (int) the number of milliseconds the request is valid for

```
transfer = client.transfer_margin_to_spot(asset='BTC', amount='1.1')
```

Returns API response

```
{
    "tranId": 100000001
}
```

Raises BinanceRequestException, BinanceAPIException

transfer_spot_to_isolated_margin(**params)

Execute transfer between spot account and isolated margin account.

https://binance-docs.github.io/apidocs/spot/en/#isolated-margin-account-transfer-margin

Parameters

- asset (str) name of the asset
- **symbol** (str) pair symbol
- amount (str) amount to transfer
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

```
{
    "tranId": 100000001
}
```

Raises BinanceRequestException, BinanceAPIException

transfer_spot_to_margin(**params)

Execute transfer between spot account and cross-margin account.

https://binance-docs.github.io/apidocs/spot/en/#cross-margin-account-transfer-margin-transfer-margin-transfer-margin-transfer-margin-transfer-margin-transfer-margin-transfe

Parameters

- asset (str) name of the asset
- amount (str) amount to transfer
- recvWindow (int) the number of milliseconds the request is valid for

```
transfer = client.transfer_spot_to_margin(asset='BTC', amount='1.1')
```

```
{
    "tranId": 100000001
}
```

Raises BinanceRequestException, BinanceAPIException

```
universal_transfer(**params)
```

Unviversal transfer api accross different binance account types

https://binance-docs.github.io/apidocs/spot/en/#user-universal-transfer

```
withdraw(**params)
```

Submit a withdraw request.

https://binance-docs.github.io/apidocs/spot/en/#withdraw-sapi

Assumptions:

- You must have Withdraw permissions enabled on your API key
- You must have withdrawn to the address specified through the website and approved the transaction via email

Parameters

- coin (str) required
- withdrawOrderId (str) optional client id for withdraw
- network (str) optional
- address (str) optional
- amount (decimal) required
- **transactionFeeFlag** (bool) required When making internal transfer, true for returning the fee to the destination account; false for returning the fee back to the departure account. Default false.
- name (str) optional Description of the address, default asset value passed will be used
- recvWindow (int) the number of milliseconds the request is valid for

Returns API response

```
{
    "id":"7213fea8e94b4a5593d507237e5a555b"
}
```

Raises BinanceRequestException, BinanceAPIException, BinanceWithdrawException

depthcache module

```
\begin{tabular}{ll} {\bf class} & binance.depthcache. {\bf BaseDepthCacheManager} (client, & symbol, & loop=None, & refresh_interval=None, & bm=None, \\ & limit=10, conv\_type=<\!class 'float'>) \end{tabular}
```

Bases: object

```
DEFAULT REFRESH = 1800
     TIMEOUT = 60
     __init__ (client, symbol, loop=None, refresh_interval=None, bm=None, limit=10, conv_type=<class
           Create a DepthCacheManager instance
               Parameters
                     • client (binance.Client) - Binance API client
                     • loop -
                     • symbol (string) – Symbol to create depth cache for
                     • refresh_interval (int) - Optional number of seconds between cache refresh,
                       use 0 or None to disable
                     • bm (BinanceSocketManager) - Optional BinanceSocketManager
                     • limit (int) – Optional number of orders to get from orderbook
                     • conv_type (function.) - Optional type to represent price, and amount, default
                       is float.
     close()
           Close the open socket for this manager
               Returns
     get depth cache()
          Get the current depth cache
               Returns DepthCache object
     get_symbol()
          Get the symbol
               Returns symbol
     recv()
class binance.depthcache.DepthCache(symbol, conv_type=<class 'float'>)
     Bases: object
     __init__ (symbol, conv_type=<class 'float'>)
          Initialise the DepthCache
               Parameters
                     • symbol (string) – Symbol to create depth cache for
                     • conv_type (function.) - Optional type to represent price, and amount, default
                       is float.
     add_ask(ask)
           Add an ask to the cache
               Parameters ask -
               Returns
     add_bid(bid)
           Add a bid to the cache
               Parameters bid -
```

Returns

```
get_asks()
```

Get the current asks

Returns list of asks with price and quantity as conv_type.

```
[
   0.0001955, # Price
   57.0' # Quantity
],
[
   0.00019699,
   778.0
],
[
   0.000197,
    64.0
],
   0.00019709,
   1130.0
],
   0.0001971,
   385.0
```

get_bids()

Get the current bids

Returns list of bids with price and quantity as conv_type

```
[
   [
       0.0001946, # Price
       45.0 # Quantity
   ],
       0.00019459,
       2384.0
   ],

                          symbol,
                                    loop=None,
                                                  refresh_interval=None,
                                                                          bm=None,
                                                                                       limit=500,
                 conv_type=<class 'float'>, ws_interval=None)
          Initialise the DepthCacheManager
               Parameters
                     • client (binance.Client) - Binance API client
                     • loop – asyncio loop
                     • symbol (string) – Symbol to create depth cache for
                     • refresh_interval (int) - Optional number of seconds between cache refresh,
                       use 0 or None to disable
                     • limit (int) – Optional number of orders to get from orderbook
                     • conv_type (function.) - Optional type to represent price, and amount, default
                       is float.
                     • ws_interval (int) - Optional interval for updates on websocket, default None.
                       If not set, updates happen every second. Must be 0, None (1s) or 100 (100ms).
class binance.depthcache.OptionsDepthCacheManager(client, symbol, loop=None, re-
                                                                 fresh interval=None,
                                                                                       bm=None,
                                                                 limit=10,
                                                                                conv_type=<class
                                                                 'float'>)

helpers module
binance.helpers.convert_ts_str(ts_str)
binance.helpers.date_to_milliseconds(date\_str: str) \rightarrow int
     Convert UTC date to milliseconds
     If using offset strings add "UTC" to date string e.g. "now UTC", "11 hours ago UTC"
     See dateparse docs for formats http://dateparser.readthedocs.io/en/latest/
          Parameters date_str - date in readable format, i.e. "January 01, 2018", "11 hours ago UTC",
               "now UTC"
```

```
binance.helpers.interval_to_milliseconds (interval: str) \rightarrow Optional[int] Convert a Binance interval string to milliseconds
```

Parameters interval – Binance interval string, e.g.: 1m, 3m, 5m, 15m, 30m, 1h, 2h, 4h, 6h, 8h, 12h, 1d, 3d, 1w

Returns int value of interval in milliseconds None if interval prefix is not a decimal integer None if interval suffix is not one of m, h, d, w

```
binance.helpers.round\_step\_size (\textit{quantity:} Union[float, decimal.Decimal], step\_size: \\ Union[float, decimal.Decimal]) \rightarrow float
```

Rounds a given quantity to a specific step size

Parameters

- quantity required
- step_size required

Returns decimal

websockets module

```
class binance.streams.BinanceSocketManager(client:
                                                                binance.client.AsyncClient,
                                                 loop=None, user_timeout=300)
    Bases: object

    STREAM_URL = 'wss://stream.binance.{}:9443/'
    VSTREAM_TESTNET_URL = 'wss://testnetws.binanceops.{}/'
    VSTREAM_URL = 'wss://vstream.binance.{}/'
    WEBSOCKET_DEPTH_10 = '10'
    WEBSOCKET DEPTH 20 = '20'
    WEBSOCKET DEPTH 5 = '5'
    __init__ (client: binance.client.AsyncClient, loop=None, user_timeout=300)
         Initialise the BinanceSocketManager
             Parameters client (binance.AsyncClient) - Binance API client
    aggtrade_futures_socket (symbol: str, futures_type: binance.enums.FuturesType = <Fu-</pre>
                                turesType.USD_M: 1>)
         Start a websocket for aggregate symbol trade data for the futures stream
```

Parameters

- symbol required
- futures_type use USD-M or COIN-M futures default USD-M

Returns connection key string if successful, False otherwise

Message Format

```
"e": "aggTrade", // Event type
"E": 123456789, // Event time
"s": "BTCUSDT", // Symbol
"a": 5933014,
               // Aggregate trade ID
"p": "0.001",
               // Price
"q": "100",
               // Quantity

"T": 123456785, // Trade time
"m": true,
               // Is the buyer the market maker?
```

aggtrade_socket (symbol: str)

Start a websocket for symbol trade data

https://github.com/binance-exchange/binance-official-api-docs/blob/master/web-socket-streams.md# aggregate-trade-streams

Parameters symbol (str) – required

Returns connection key string if successful, False otherwise

Message Format

```
"e": "aggTrade",
                                # event type
"E": 1499405254326,

```

all_mark_price_socket (fast: bool = True, futures_type: binance.enums.FuturesType = <FuturesType.USD_M: 1>)

Start a websocket for all futures mark price data By default all symbols are included in an array. https://binance-docs.github.io/apidocs/futures/en/#mark-price-stream-for-all-market:param fast: use faster or 1s default:param futures_type: use USD-M or COIN-M futures default USD-M:returns: connection key string if successful, False otherwise Message Format .. code-block:: python

```
all_ticker_futures_socket (futures_type: binance.enums.FuturesType = <Fu-
turesType.USD_M: 1>)
```

Start a websocket for all ticker data By default all markets are included in an array. https://binance-docs.

github.io/apidocs/futures/en/#all-book-tickers-stream :param futures_type: use USD-M or COIN-M futures default USD-M :returns: connection key string if successful, False otherwise Message Format .. code-block:: python

```
[
    { "u":400900217, // order book updateId "s":"BNBUSDT", // symbol
    "b":"25.35190000", // best bid price "B":"31.21000000", // best bid qty
    "a":"25.36520000", // best ask price "A":"40.66000000" // best ask qty
}
```

book ticker socket()

Start a websocket for the best bid or ask's price or quantity for all symbols.

https://github.com/binance-exchange/binance-official-api-docs/blob/master/web-socket-streams.md# all-book-tickers-stream

Returns connection key string if successful, False otherwise

Message Format

```
{
    // Same as <symbol>@bookTicker payload
}
```

coin_futures_socket()

Start a websocket for coin futures data

https://binance-docs.github.io/apidocs/delivery/en/#websocket-market-streams

Returns connection key string if successful, False otherwise

Message Format - see Binance API docs for all types

depth_socket (*symbol: str, depth: Optional[str] = None, interval: Optional[int] = None*) Start a websocket for symbol market depth returning either a diff or a partial book

https://github.com/binance-exchange/binance-official-api-docs/blob/master/web-socket-streams.md# partial-book-depth-streams

Parameters

- **symbol** (str) required
- **depth** (str) optional Number of depth entries to return, default None. If passed returns a partial book instead of a diff
- **interval** (*int*) optional interval for updates, default None. If not set, updates happen every second. Must be 0, None (1s) or 100 (100ms)

Returns connection key string if successful, False otherwise

Partial Message Format

(continues on next page)

(continued from previous page)

Diff Message Format

```
"e": "depthUpdate", # Event type
"E": 123456789, # Event time

        []
    ]
]
```

Start a multiplexed socket using a list of socket names. User stream sockets can not be included.

Symbols in socket name must be lowercase i.e bnbbtc@aggTrade, neobtc@ticker

Combined stream events are wrapped as follows: {"stream":"<streamName>","data":<rawPayload>}

https://github.com/binance-exchange/binance-official-api-docs/blob/master/web-socket-streams.md

Parameters

- streams list of stream names in lower case
- futures_type use USD-M or COIN-M futures default USD-M

Returns connection key string if successful, False otherwise

Message Format - see Binance API docs for all types

futures socket()

Start a websocket for futures data

https://binance-docs.github.io/apidocs/futures/en/#websocket-market-streams

Returns connection key string if successful, False otherwise

Message Format - see Binance API docs for all types

```
index_price_socket (symbol: str, fast: bool = True)
```

Start a websocket for a symbol's futures mark price https://binance-docs.github.io/apidocs/delivery/en/#index-price-stream :param symbol: required :param fast: use faster or 1s default :returns: connection key string if successful, False otherwise

Start a futures websocket for a single symbol's ticker data https://binance-docs.github.io/apidocs/futures/en/#individual-symbol-ticker-streams :param symbol: required :type symbol: str :param futures_type: use USD-M or COIN-M futures default USD-M :returns: connection key string if successful, False otherwise .. code-block:: python

```
{ "e": "24hrTicker", // Event type "E": 123456789, // Event time "s": "BTCUSDT", // Symbol "p": "0.0015", // Price change
```

isolated_margin_socket (symbol: str)

Start a websocket for isolated margin data

https://binance-docs.github.io/apidocs/spot/en/#listen-key-isolated-margin

Parameters symbol (str) – required - symbol for the isolated margin account

Returns connection key string if successful, False otherwise

Message Format - see Binance API docs for all types

```
kline_socket (symbol: str, interval='1m')
```

Start a websocket for symbol kline data

https://github.com/binance-exchange/binance-official-api-docs/blob/master/web-socket-streams.md# klinecandlestick-streams

Parameters

- **symbol** (str) required
- interval (str) Kline interval, default KLINE_INTERVAL_1MINUTE

Returns connection key string if successful, False otherwise

Message Format

(continues on next page)

(continued from previous page)

```
"T": 1499404919999,

       "B": "13279784.01349473" # can be ignored
```

margin_socket()

Start a websocket for cross-margin data

https://binance-docs.github.io/apidocs/spot/en/#listen-key-margin

Returns connection key string if successful, False otherwise

Message Format - see Binance API docs for all types

```
miniticker socket (update time: int = 1000)
```

Start a miniticker websocket for all trades

This is not in the official Binance api docs, but this is what feeds the right column on a ticker page on Binance.

Parameters update_time (int) – time between callbacks in milliseconds, must be 1000 or greater

Returns connection key string if successful, False otherwise

Message Format

multiplex_socket (streams: List[str])

Start a multiplexed socket using a list of socket names. User stream sockets can not be included.

Symbols in socket name must be lowercase i.e bnbbtc@aggTrade, neobtc@ticker

Combined stream events are wrapped as follows: {"stream":"<streamName>","data":<rawPayload>}

https://github.com/binance-exchange/binance-official-api-docs/blob/master/web-socket-streams.md

Parameters streams (list) – list of stream names in lower case

Returns connection key string if successful, False otherwise

Message Format - see Binance API docs for all types

```
options_depth_socket (symbol: str, depth: str = '10')
```

Subscribe to a depth data stream

https://binance-docs.github.io/apidocs/voptions/en/#market-streams-payload-depth

Parameters

- **symbol** (str) required
- **depth** (str) optional Number of depth entries to return, default 10.

```
options_kline_socket (symbol: str, interval='1m')
```

Subscribe to a candlestick data stream

https://binance-docs.github.io/apidocs/voptions/en/#market-streams-payload-candle

Parameters

- **symbol** (str) required
- interval (str) Kline interval, default KLINE INTERVAL 1MINUTE

```
options_multiplex_socket (streams: List[str])
```

Start a multiplexed socket using a list of socket names. User stream sockets can not be included.

Symbols in socket name must be lowercase i.e bnbbtc@aggTrade, neobtc@ticker

Combined stream events are wrapped as follows: {"stream":"<streamName>","data":<rawPayload>}

https://binance-docs.github.io/apidocs/voptions/en/#account-and-trading-interface

Parameters streams (list) – list of stream names in lower case

Returns connection key string if successful, False otherwise

Message Format - see Binance API docs for all types

```
options_recent_trades_socket (symbol: str)
```

Subscribe to a latest completed trades stream

https://binance-docs.github.io/apidocs/voptions/en/#market-streams-payload-latest-completed-trades

Parameters symbol (str) – required

```
options_ticker_socket (symbol: str)
```

Subscribe to a 24 hour ticker info stream

https://binance-docs.github.io/apidocs/voptions/en/#market-streams-payload-24-hour-ticker

Parameters symbol (str) - required

symbol_book_ticker_socket (symbol: str)

Start a websocket for the best bid or ask's price or quantity for a specified symbol.

https://github.com/binance-exchange/binance-official-api-docs/blob/master/web-socket-streams.md# individual-symbol-book-ticker-streams

```
Parameters symbol (str) - required
```

Returns connection key string if successful, False otherwise

Message Format

```
symbol_mark_price_socket(symbol: str, fast: bool = True, futures_type: bi-
nance.enums.FuturesType = <FuturesType.USD M: 1>)
```

Start a websocket for a symbol's futures mark price https://binance-docs.github.io/apidocs/futures/en/#mark-price-stream:param symbol: required:param fast: use faster or 1s default:param futures_type: use USD-M or COIN-M futures default USD-M: returns: connection key string if successful, False otherwise Message Format .. code-block:: python

```
{ "e": "markPriceUpdate", // Event type "E": 1562305380000, // Event time "s": "BT-CUSDT", // Symbol "p": "11185.87786614", // Mark price "r": "0.00030000", // Funding rate "T": 1562306400000 // Next funding time
```

Start a websocket for a symbol's ticker data By default all markets are included in an array. https://binance-docs.github.io/apidocs/futures/en/#individual-symbol-book-ticker-streams :param symbol: required :param futures_type: use USD-M or COIN-M futures default USD-M :returns: connection key string if successful, False otherwise .. code-block:: python

```
{ "u":400900217,  // order book updateId "s":"BNBUSDT",  // symbol
    "b":"25.35190000",  // best bid price "B":"31.21000000",  // best bid qty
    "a":"25.36520000",  // best ask price "A":"40.66000000" // best ask qty
}
```

symbol_ticker_socket (symbol: str)

Start a websocket for a symbol's ticker data

https://github.com/binance-exchange/binance-official-api-docs/blob/master/web-socket-streams.md# individual-symbol-ticker-streams

```
Parameters symbol (str) – required
```

Returns connection key string if successful, False otherwise

Message Format

```
{
    "e": "24hrTicker", # Event type
    "E": 123456789, # Event time
    "s": "BNBBTC", # Symbol
    "p": "0.0015", # Price change
```

ticker socket()

Start a websocket for all ticker data

By default all markets are included in an array.

https://github.com/binance-exchange/binance-official-api-docs/blob/master/web-socket-streams.md# all-market-tickers-stream

Parameters coro (function) – callback function to handle messages

Returns connection key string if successful, False otherwise

Message Format

```
'F': 278610,
'o': '0.07393000',
's': 'BCCBTC',
